The problem is that amateurs cannot live with the fact that someone implemented a codec that is better than what they can develop themselves.

There would be no problem when amateurs could actually develop a better codec than AMBE. But they have not shown they can.

Everyone can put up a site with a statement that they want to develop something and need donations. But this development needs more than donations.

Sometimes is it better to just admit that someone did a better job than you could have done yourself, and just pay him for the work.

Really? I thought that what those of us that can't live with it thought is that we don't like technology that locks out homebrew. That's what the use of DVSI's AMBE codec does.

I don't know exactly why JARL chose AMBE other than because it was the only codec available at the time. If so, they should have thought about that a lot harder and perhaps decided to sponsor the development of a free codec instead. That would have been really good, but I suppose I can see that it would have introduced a delay. D-STAR has other faults, one being that it appears not to be extensible so that there is no way to include other codecs and allow the correct one to be used according to the other user's set up.

>
> There would be no problem when amateurs could actually develop a better codec than AMBE. But they have not shown they can.

Well we'll see won't we? It's taken a while to find people with the necessary expertise but Codec2 is now moving forward with people working on it that have that expertise.

Yes, it needs talent and for that you need exposure to collect them together. That's happening now.

I have no problem with that, remember that the "free" part of free software is referring to freedom, not money. But if someone refuses to provide something that I can look inside and understand then I won't use it.

It's called a choice.

I think you need to study the implications of the words 'amateur', 'professional' and 'commercial', and then have a read of the Amateur licence.

Probably, yes.

Done similar in the past (modified firmware/programming software to let
commercial radios go out of band).

But if I want to operate on a given mode (AM/FM/SSB etc), I can build my
own, should I so choose, from whichever components I so choose.

If I was to lose my mind and choose to operate D-Star, I MUST buy an
AMBE chip.

That's not strictly true. The whole point of a patent (from the Latin 'patere' - to reveal) is that an inventor discloses the workings of his invention to the public in return for legal protection and the exclusive right to prevent others from exploiting his invention commercially. It does not prevent others from studying the invention and designing improvements and even patenting those improvements if they meet the required criteria. Of course, it will not be possible to exploit those improvements without the permission of the holder of the original patent (and vice versa). Whether an individual may build a patented device for personal 'research' purposes will depend on the patent law in the country where the patent was granted.

I agree.

Whether an individual may build a patented device for personal 'research' purposes will depend on the patent law in the country where the patent was granted.

The problem is that with something like AMBE, which is an algorithm, the patents actually only apply to a few absolutely crucial operations in the encoding/decoding but the text of the patent is as vague as possible so that the patent can then be as widely applied as possible and thus cover many alternative ways of doing the same thing.

It's nothing more than legalised extortion in reality, the existence of the patent reveals very little to anybody because it's been written to avoid doing exactly that. So the idea of the protection given balancing the revelation of commercially beneficial information has disappeared into the mists of time and patents are now used as a way to tie your competitors up in legal knots even in the case of obvious and trivial claims.

Now suppose that someone reverse engineered AMBE and made it available to radio amateurs by putting the information into the public domain. DVSI would have to take action to prevent this, because by not doing so

they would be undermining their own patent since failing to defend
against an infringing implementation could easily lead to the patent
becoming worthless.

Not really. You can buy the chip that implements AMBE and use it as part of a homebrew design.
That is really not much different from buying a power transistor to get 100 Watts of output from your homebrew transceiver instead of developing your own, or making your own transmitter tube.
Everyone chooses their own level of components to work from. Some build the microcontroller for their transceivers from a Z-80, an EPROM, a CMOS RAM and some LSTTL logic. Others use an integrated microcontroller with everything on a chip. Still others buy a small board with a functioning computer system on it and use it as part of their transceiver.

When the chose AMBE there really was no alternative. And even today, you will not be able to find an open codec that offers speech quality at the bitrate and bit error resilience that the AMBE codec does.

It is very easy to write "then lets develop that" and apparently much harder to actually do so.

W.r.t. extensibility, it would sure be nice if codecs could be negotiated and an alternative could be added, but it would not bring much to D-STAR as there still would be different worlds of users that cannot talk to eachother (those with the commercial Icom transceivers that have AMBE and nothing else, and those with the homebrew transceivers with open codec and no AMBE).

Given enough time, it could be that something is developed that is
open and does not violate patents.  But I think it will take a lot
of time and there is little chance that at the end of this development
there is still a userbase left that wants to buy and use products
based on it.

That is your choice.   But that does not mean that others are wrong.

Oh dear Rob, you must be new here! While what you say is, of course, correct it isn't accepted by bigots.

If half of those who are so "anti" DStar got on an developed an alternative CODEC (and it is just the CODEC which is proprietary), this debate would have ended long ago. As it is, by the time the alternate CODEC becomes viable, I fully expect that such systems will be so "yesterday".

Amateur radio has many facets, DStar is simply one of them. Why can't people be left to enjoy their pet facets while others get on and enjoy theirs?

Because D-Star isn't amateur radio.

There is no experimentation involved, and can't be.

I know, but that's *exactly* what a lot of people don't want to do.

I think there is. Generating RF power from a transistor is not a patented process, although the actual device may have some patents that apply to it. If I had the money and skills I could build my own, but that particular battle makes no sense. Not using a component that includes an implementation of an algorithm that I'm not allowed to see and understand is a different level from that, there is no secret sauce in a power transistor but there is in the program that a DSP chip runs.

Indeed.

Yet. The aim of Codec2 is to provide exactly that.

Of course, but there are people who can do it. I happen to care enough to encourage them and put some money into the venture to pay for their time.

I'm not interested in bringing something to D-STAR, I'm interested in bringing something to amateur radio that provides the opportunity to break away from a proprietary solution that doesn't offer a way of doing the self-training bit of the licence.

Except that without actually achieving this it won't be possible to tell, I'd prefer to do it and then see what happens. Part of the attraction of Codec2 is that it doesn't only apply to amateur radio, it's something that can be used in other free software/hardware projects such as low cost telephony for developing countries with poor infrastructure.

Indeed. But until everyone has the choice between something they control and something that they cannot control now, and probably never will be able to, it is not possible to decide which solution is the more sensible.

I'm not trying to kill D-STAR (although I would prefer that it had never happened in its current form), but one of its problems is that it doesn't encourage the best implementation because it comes in one form only. If there are alternate ways to build compatible equipment then the path to achieving the maximum performance is opened.

I don't want to see any of the other non-open digital radio standards
come into amateur radio either, I'm not actually against anything other
than the sacrifice of our ability to create our own designs without
having to use something that isn't free (as in freedom).

Over here it is probably the mode with the most experimentation going
on in ham radio today...

Of couse not with the codec.
But in any communication system there are things that cannot be changed
or incompatability would result.
That does not mean there cannot be experiments elsewhere in the system,
or in the application of the system as a whole.

Remember packet. The AX.25 protocol was open, but it could not really be
changed because that would break compatability between the many
implementations that existed after some time.   It was very clear that
a couple of critical mistakes were made in the design, and there were
proposals on how to fix them, but they never took off as it simply
wasn't practical to change AX.25
It really made no difference if it was open or closed, it was unchangable
anyway.

Yet, amateurs used it as a black-box building block in many applications
and experimented a lot with it.

I think you'll find that the only bigots involved here are the sort that believe that amateur radio should encourage the use of closed technology.

I believe that we should encourage the use of open technology and allow radio amateurs to own their future. A sure way to kill amateur radio is to make it dependent on corporations who do not share our interests at a fundamental level.

And ultimately it failed (what's left of the packet network is a shadow of what it was) because of that lack of flexibility.

Amateur radio has a difficult-to-overcome problem in that we always build systems from the bottom up and don't design in the features that allow growth and variation. D-STAR is another example of a system that shares that same fault.

I hope that it's possible to create something that doesn't have these limitations, provides better function and allows more experimentation with all aspects of the technology.

I think we should not encourage the use of closed technology, and I
think many agree with that.

But I also think we should not discourage developments (in the case of
D-STAR the development of a digital radio system) because in critical
places in the system open technology does not exist, and development
of such open technology is impractical.

In such cases we should allow, not encourage, the use of closed
technology.

I see the chip with the AMBE codec as a component. A component for
which we don't fully understand how it works, but we know how to
use it as part of a design.

Many amateurs have built electronics devices using components they
did not fully understand how they were designed. Or did not care.
It is possible to build an amateur radio transceiver using application
notes for integrated circuits and other devices without really knowing
what is inside the integrated circuits.

The AMBE codec is just such a circuit, just like an IF amp/demodulator
that you put in your receiver design by just copying the application note's
circuit.

I don't recall anyone seeking to only to encourage the use of closed
technology. May be some who are happy to use closed technology and those who
are happy to see that happen.

If the CODEC was open, or if the open CODEC ever comes to fruition, would
you have the knowledge / skills to undertake any meaningful experimentation
or even the remotest prospect of developing those skills?

Which is something the "anti" AMBE CODEC people ignore.

If the open CODEC happens, their scope to "experiment" with it will be
limited- unless they only want to talk to themselves or with others they've
co-ordinated experiments with.

That doesn't matter, the point is someone will have and will do so. We
can't all do everything in amateur radio, but we should not prevent
those that want to do something in particular from being able to do it.

Exactly, so let those happy with DSTAR and the AMBE CODEC use it and enjoy it.

You can do the same with your pet interests.

Win-Win.

It is, but in the case of every other device it is possible to find out
what's in there at least to a level where a full understanding is
possible. And doing so would not be illegal.

Well, once the legal system gets, or threatens to get, involved then I'd
contend that it isn't the same as a generic component. But I think we're
close enough in the discussion now that we can let it rest :)

Well the plan is that eventually any closed system becomes out evolved,
so the advantages of the open alternative become available to all. I am
more than happy to share, DVSI are not.

I have no problem with allowing evolution to decide the future, it's a
good idea to make sure that some diversity evolves to allow that to
happen.

Seems to me there's plenty of opportunity for flexibility with regards to codecs. The protocol could be designed to allow for negotiation of a common codec between two radios - start out with a simple "universal" codec to get the communication started, and then optionally switch to a different one.

Something like this is done in the commonest voice-over-IP protocol family (SIP). There are numerous codecs available, ranging from bog-standard telephony-style (uLaw and aLaw), to simple linear PCM, to ADPCM, to various forms of sophisticated coding and compression. Some of these require paid licenses (e.g. G729), some come with a commercial- but-free license (e.g. ILBC), some are based on patents which have now expired and can be implemented freely (e.g. versions of GSM), and some are aggressively open-source and free-as-in-speech-and-beer (e.g. Speex).

Protocol negotiation becomes tricker when you're dealing with a
repeater system, or a more-than-two-way simplex conversation, but
that's where the fun and experimentation comes in!

Yes, that's what's wanted, but the current D-STAR implementation
appears to have no flexibility to do this and there are no version
fields in the frame structure so it can't be made backwards compatible.
The design ought to have had this built in, but seems not to have
considered doing it.

There was nothing wrong with (A)X.25 it was designed for data over noisy
channels. Same with CSMA - designed for multi use of same channel. Both open
and partly developed by amateurs. Anyone remember ALOHAnet? - developed by
Univesity of Hawaii and amateurs [1] not some commercial organisation like
ICOM.

Maybe it's before you time Rob

Oh I don't know. APRS is a perfectly good solution, it's what AX.25 is soley
used for these days. We don't need location services and messaging tagged
onto D-STAR when AX.25 does this perfectly well.

Except digital voice doesn't work on noisy channels, which makes it pretty useless for _REAL radio amateurs unless someone is going to stick repeaters up every half mile. - that's gonna mean a lot of money to ICOM in my book even if there was enough fools to fund it.

Change the record Brian, you come out with the same paragraph every time
this subject comes up - and you know the answer you're going to get.

I don't have the skills, or even the time, to take part - but it doesn't
stop me from encouraging the project as a matter of principal. A closed
codec has no place in Amateur Radio.

You won't find more than a handful of amateurs who would disagree with
that (except, of course, the ones who have already bought a D-Star rig).

In this case, you can always re-flash the chip containing your chosen version of the codec.

Something very few had the capability to do back in the days when packet was a big thing, and something you're expressely forbidden to do (indeed, prevented from doing) with an AMBE DSP chip.

I just hope the RSGB is as keen to licence Codec2 based repeaters as it

Don't confuse Brian with logic, he has his faith in that choice must be good
no matter who provides it or what their motives are.

It is striking how many of the proponents of development of an open codec
and opponents of a closed codec are amongst those that do not have any
idea how to develop a codec...

ROTFL

Or have even contributed to the development fund. (It was recently reported
by a contributor to uk.radio.amateur that he was the first person to have
sent a donation. (Stands by for the latest excuse from one of our Scottish
amateurs as to why he can't cough up YETI again this month.) )

Personally, I don't see the attraction of DStar like systems, regardless of
the choice of CODEC. However, I'm more than happy for others to enjoy them.
I just wish the bleating crew would go and make this open CODEC happen.

Not only that (I have done DSP coding for filters and modems myself),
but in this case there is the additional difficulty of finding the methods
and algorithms to code speech into very few bits. This requires lots of
knowledge and research, and what is already known is usually patented.
Often the research is done partly in a scientific research institute
or at a university, and partly in a commercial company allied to such
an institute. Lots of man-hours of highly qualified people go into this.

But the community of people who think that "WE should develop an
open codec" and "when we had more donations we could..." seems to be
thinking that this is project that a couple of amateurs could do better.

We should develop an open space rocket to propel our geostationary OSCAR
into space. Sure.

But we better admit that we cannot do that and set achievable goals.

I don't know to build a nuclear power station either - doesn't stop me
being in favour of them over wind power.

Actually, I can this month. Someone remind me who I send it to please!

Can't afford it next month cos the RSGB want their fees off me then, and
I'll be on holiday for at least a week of it too - so I'd better get it
done now.

Didn't you read the first post? It's happening!

The exact same stupidity has long crippled the advancement of the
AX.25 protocol, and the APRS protocol, and nearly every other *amateur*

designed protocol.

Worse, AX.25 was coded into law (in the USA, and elsewhere), thus preventing any other air protocols from even having a chance because they could not be used, or used unattended, such as a BBS.

D*Star apparently has the same problem - it's a lot like commercial P25 (or MotoTRBO), but it's a lot different too, and there's really no way to fix that.

And how about all those surplus TETRA radios? Yah, the USA can't currently use TETRA for commercial/industrial radio, but the rest of the world does and there's nothing stopping USA hams from doing so.

I sure would like to see someone make an off-the-shelf digital voice ham radio that made use of openly-available codecs, especially if they were flashable.

AX.25's other remaining use, that of carrying tcp/ip, has also got a real problem: the minimum IPv6 packet is bigger than the maximum AX.25 packet. Oops.

Fortunately there were a couple of unused bits in the AX.25 header
that were used for AX.25 v2, DAMA, and Extended Sequence numbers.
But more flexibility would certainly have been welcome.

There is a segmentation protocol at AX.25 level (defined by Phil Karn
and used in NET/NOS) that allows the segmentation of a single IP datagram
over multiple AX.25 frames.

With a new PID it could be used for IPv6 over AX.25.

Of course, the headers of IPv4 are already considered big in the
amateur packet radio world. At the datarates typically used, one
wants to conserve on header size.

Yes, some have tried using Van Jacobsen header prediction to cut down on the size of the actual transmitted header - a rather nice solution, but not really workable in a lossy datagram world.

So far the best method seems to be (using a separate pid) an adaptation of the SLIP with compression and header prediction over a connected-mode (i.e, reliable stream). This adds packet framing and reduces the overhead a bit, and at 9600 bps or faster, is actually slightly faster than a carrier pigeon. It also places the burden of retries on the air link where it belongs, rather than end-to-end, which is clearly the wrong place to do it.

A number of F-S-U folks have been doing some very interesting work in real high-speed packet (230 kb/s or faster, some multi-Mb/s), and such links would easily support digital voice without much need for super-bandwidth-conserving codecs.

GSM and similar codecs are now easily available in software implementations; these work quite well at an air rate of 9600 or sometimes less. Some are free of significant encumbrances that would hinder widespread usage.

In the land mobile radio regime, the ultimate goal is to reduce the consumed bandwidth so as to stack more customers in the same band. Hams have no such need; if anything we have (shhh!) more bandwidth than we need on the VHF and up bands, so using extremely narrowband codecs just isn't something we need to do.

It is time to get out your favorite writing instrument and put down some good words for the next issue of PSR, TAPR's quarterly newsletter.

What project(s) are you working on? What project(s) would you like to be working on? We would like to read all about it.

Write any neat software that you'd like to brag about; we'd love to read about that, too.

Did you attend the DCC? If so, write about the experience.

Remember, if we publish your submission, we will extend your TAPR membership by a quarter year. (So if you write an article for every issue, you will never have to pay membership dues again! What a deal!!!)

So quick like a brown fox, send your submission to me, the PSR editor, by October 15, which happens to be the deadline for the next issue of PSR.

73,

wa1lou @ tapr.org

I managed to get on air with PSK31, and also found quite a few stations
to work on 3580 MHz.
I am interested in other modes, especially forward error correcting
ones. But I have yet to find stations using them.
Where do I need to look? (Frequencies, identifiying, etc)
As I am antenna limited, it will be Europe mainly.

Thanks in advance

Hi Marc,

On 20m MFSK16 can be found around 14.080, Olivia around 14.105 and MT63 on 14.1095 (not much activity). Just tune slowly from 14.070 (PSK) up to 14.110 and you should hear many things other than RTTY and CW.

Hey Marc,
Interested in doing Pactor or G-Tor on 20 M? I have a Kantronics Kam TNC &
would love to work some G-Tor with it. Email me direct mmuranetz (AT)

Hi all, I need some help with decoding APRS protocol files.
First I don't have a file to experience decoding on so can someone
please post a download link for such a file here?
Second can someone please post some links here about the APRS files
construction?

Hello Mike

Unfortunately I do not have a hardware TNC, so I cannot do Pactor or
G-Tor.

Also Canada is probably out of reach with my current antenna setup :-(

Greetings,

Besser Associates is offering their acclaimed "DSP Made Simple for Engineers" class in San Jose, California, on 17-19 February 2010.

This 3-day class is particularly well-suited to those involved in RF and audio signal processing, and computer programmers, who need to learn the fundamentals of DSP theory. Details of this course, including target audience, learning objectives, course outline, materials descriptions, and past student comments are contained in this post as items "A" through "I".

To register, please contact Besser Associates at Phone: (650)949-3300. For additional course offerings, call Besser Associates or visit http://www.bessercourse.com/ to view our public course catalog and current schedule.

------ Detailed DSP course information follows ------

A. BESSER COURSE TITLE:
"DSP Made Simple for Engineers"; a 3-day tutorial course on digital signal processing (DSP) theory.

B. TARGET AUDIENCE

* The primary audience is practicing RF (and Audio) hardware Engineers and Software Programmers who need to understand digital signal processing (DSP) because of its ever-increasing role in the processing of real-world signals.

* While DSP Made Simple is not a "programming course", it is particularly well suited for computer programmers because of their increasing need to understand DSP algorithms.

* In general, this course is beneficial to anyone involved in the acquisition, generation, transmission, filtering, or analysis of digital signals.

C. WHAT THE STUDENT GAINS FROM THE COURSE:

* The ability to apply DSP techniques to real-world signal processing problems in their work.

* A solid grasp of DSP basics and the ability to move gradually to more sophisticated DSP concepts and applications.

* The ability to speak the language of DSP.

* Much practical information on how to optimize (streamline the computations of) the algorithms of DSP.

* The ability to understand written descriptions (articles, application notes, textbooks) of DSP methods used in practice.

To register, please contact Besser Associates at Phone: (650)949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

E. WHAT THE COURSE DOES NOT COVER:

The DSP Made Simple Course does not cover the hardware architecture of commercial programmable DSP integrated circuits. Likewise, while the course introduces the topic of commercially available DSP design software packages, no computer programming is performed as part of the course.

F. COURSE HANDOUT MATERIAL

The training material comprises 475 pages of class handouts. With the typical lecturer, the student must decide between taking notes, or paying attention to what the lecturer is saying. The training handout solves this "note-taking" dilemma. The DSP Made Simple training material provides a "bulletized" description of each DSP topic in addition to an abundance of diagrams. A textual description summarizing the key DSP concepts are included at the bottom of each handout page.

The highly praised DSP textbook, "Understanding Digital Signal Processing, 2/E" (Prentice Hall Publishing) will be supplied to each student. This book has been Amazon.com's top-selling DSP book for over five years.

G. COURSE LECTURER:

RICHARD LYONS is a Consulting Systems Engineer and lecturer with Besser Associates in Mt. View, CA. He has been the Lead Hardware Engineer for numerous large signal processing systems for both the National Security Agency (NSA) and TRW Inc. An experienced lecturer, and past instructor at the University of California Santa Cruz Extension, Richard has delivered signal processing seminars and training courses throughout the US and Europe. As an Associate Editor for the IEEE Signal Processing Magazine, he created and edits the magazine's "DSP Tips & Tricks" column. He has written numerous articles on DSP topics, and authored the best selling textbook "Understanding Digital Signal Processing 2/E" (Prentice Hall, 2004). He is also the Editor of, and contributor to, the Wiley & Sons/IEEE Press book: "Streamlining DSP, A tricks of the Trade Guidebook". Richard is a member of the IEEE, and Eta Kappa Nu the electrical engineering honor society. He can be contacted at: R.Lyons@ieee.org.

H. WHAT'S GOOD ABOUT THE COURSE

* Instead of overwhelming the student with complex mathematics, the lecturer uses intuitive explanations and well-chosen examples to develop a fundamental understanding of DSP theory. (A recipe for technical material that's too rich in equations is hard for the beginner to digest.)

* The practical aspects of signal processing techniques are stressed as opposed to mathematically rigorous discussions of discrete system theory. THIS COURSE TEACHES THE STUDENTS HOW TO USE DSP IN THEIR WORK.

* Comprehensive in scope, and gentle in approach, the course gives the student a thorough grasp of the basics and the ability to move on to more sophisticated DSP concepts and applications.

* In addition to covering the key practical aspects of DSP, a collection of tricks-of-the-trade used by DSP professionals, to make their processing more efficient, are introduced throughout the course.

* In terms of DSP training, this course is the beginner's best opportunity to efficiently and thoroughly learn the fundamentals of DSP.

I. QUOTES FROM RECENT STUDENTS:

> "Excellent course for engineers wanting to get (an) insight into DSP."
>
> - George Hughes, Lockheed Martin

"Instructor takes a traditionally difficult subject to learn,
and made it easy. His printed material is excellent."
- William Schnable, Lucent Technologies

"I appreciated the instructor's ability to communicate complex
subjects in a simple format. This course is in my top 3 of
'Best Ever' (in 20 years)."
- Brian Kralicek, Nokia

"Lyons presents a very solid engineering perspective of the
subject with a minimal, yet sufficient, amount of math."
- Gene Kozin, Itron Inc.

"... great instructor. I now understand what the college
professors were trying to teach."
- Simon Sirin, U.S. Dept. of Energy

"This course takes the mystery out of DSP. Instructor has
a knack for presenting information in a way that is very
logical and easy to understand."
- Dale Laing, Lockheed Martin

"Lyons' is an excellent communicator of highly technical
material. He uses plenty of real examples to translate
theory to something of utility."
- David Day, Day Test and Measurement Inc.

To register for the class, please contact Besser Associates at
Phone: (650)949-3300. For additional course offerings, call Besser
Associates or visit http://www.bessercourse.com/ to view our

Am I missing something or was this posted on the last day of the
class? This makes me think of the Russian Comedian Smirnov who opens
the newspaper and reads the ad that says: "Big Sale - Last Week" He
comments so all right I didn't go, but do you have to rub it in?

It is with great sadness that we report the passing of friend Dave Toth on February 26, 2010. Dave was President Emeritus of TAPR and also served as its President (2005-2009) and as a member of its Board of Directors (1987-1993 and 2004-2010). VE3GYQ will be best remembered for his dry sense of humor and his efforts to make TAPR's participation in the HPSDR project a resounding success.

Dave's Obituary reads:

Dr. David Bradley Toth, 55, died at 3:10 p.m. Feb. 26, 2010, at his residence.

He was born Aug. 11, 1954, in Windsor, Ontario, to Thomas S. and Magda M. Kachler Toth. His mother survives in Windsor. On June 16, 2009, he married Ronda S. Nartker, who survives in Spencerville.

Dr. Toth graduated from the University of Western Ontario Medical School in 1978. He practiced family medicine in London, Ontario. He moved to the U.S. in 1993 and began a career in emergency medicine. He was a partner of Premier Health Care Services, in Dayton, and worked at Lima Memorial Health System and St. Rita(tm)'s Medical Center until the time of his illness. He was a member of the American College of Emergency Physicians, College of Physicians and Surgeons of Ontario. He was board certified in Family Medicine of Canada. He was president of the Regional Physician Advisory Board of EMS and was also the medical director of Ada, Bath and Spencerville EMS.

He was a private pilot for 30 years. He loved to go to the Allen County Airport and fly his Twin Comanche as much as possible. He was a member of the Aircraft Owners and Pilots Association, EAA and the Comanche Flyers. Besides flying, he was an amateur astronomer. Since he was a young boy in school, he enjoyed looking at the night sky and reading about space and the stars. He had his own observatory that was seen opened up on clear nights. He set up the London, Ontario, Astronomy Club and served as its president. He was also a member of the Royal Astronomical Society of Canada and belonged to the Lima, Dayton and Columbus Astronomy Clubs. He traveled for NASA to Chile and Australia to fix telescope problems. He worked closely with Software Bisque to make computer programs to operate telescopes. You could catch him planning trips to Starfest and the Winter Star Party yearly.

He was also a HAM radio operator since the 1970s. He would talk for hours with his call sign VE3GYQ. He set up the London, Ontario, towers. He was the Tucson Amateur Packet Radio president from 2004 to 2009. In his spare time, he enjoyed a round or two of golf with partners or for fundraisers. He also enjoyed hitting the slopes if possible to ski.

Survivors also include two sons, Michael Toth, of Bowling Green, and Christopher Toth, of London, Ontario; a daughter, Caitlin Toth, of Montreal; a stepson, Rusty Nartker, of Spencerville; two brothers, Brian (Susan) Toth, of London, Ontario, and Darryl (Helena) Toth, of Lakeshore, Ontario; two sisters, Stephanie (Frank) Capizzi, of Shelby Township, Mich., and Sondra (Dana) Woltz, of Windsor, Ontario; an aunt, Apollonia "Loni" Noll of Windsor, Ontario; and numerous nephews and nieces.

Services will begin at 10:30 a.m. Wednesday at St. Charles Catholic Church. Father Stephen Blum will officiate. Burial of the cremated remains will be at a later date.

Friends may call from 3 to 8 p.m. Monday and 1 to 8 p.m. Tuesday at the Shawnee Chapel of Chiles-Laman Funeral Homes, where a parish wake service will begin at 8 p.m. Tuesday.

If you are an educator or if you know of one who might be interested in learning more about wireless technology, here is an announcement from ARRL HQ.

73, Art K�AIZ

****

We are currently accepting enrollments for the 2010 sessions of the Teachers Institute on Wireless Technology. Word of mouth has often been our best recruiting method so we invite the ham radio community to recruit teachers in their local schools who would find this opportunity interesting and rewarding.

The Teachers Institute is an exceptional professional development opportunity for teachers who want to explore the fundamentals of wireless technology, basic electronics, robotics and use amateur radio as a tool for learning in the classroom. The four day expenses paid seminar is funded by ARRL Education & Technology Fund donors. Teachers can also apply for graduate credit for the seminar.

The schedule of dates and locations for this year's sessions, as well as an agenda of topics, a downloadable brochure and applications are available on our website at www.arrl.org/ti. If you would like to request copies of the printed brochure, please contact the Education Services Dept. at ead@arrl.org.

The Spring issue of TAPR's quarterly newsletter, Packet Status Register (PSR), is in the works. If you would consider writing something for PSR, the PSR editorial board would seriously consider publishing it. The deadline for the Spring issue is April 15, so you have one month to write something!

The Spring issue appears just before the Dayton Hamvention, so if you want to write something that ties in with the Hamvention, then even better!

Thank-you and 73,

Stan, WA1LOU

Why use something as fancy as DOS when you can rock out an Apple II or
Commodore 64? I believe there are some modes workable on those.

Many thanks for the info there. I did manage to find a solution, it
turned out that my soundcard needed a calibration. Obvious no problems
with normal audio/movies but with SeaTTY it was quite needed.

Rob,

The short answer is they just didn't build it that way. In talking with the Yaesu guys at Dayton, I asked why they did not make it available. The answer was something like, "We get that question a lot, and Yaesu is looking at whether it can be changed in firmware."

Thank you for the reply Alan. It would have been a very nice
capability and would have made the radio even more attractive.

Returning to packet after many years away, will soon have a new radio for VHF/UHF packet. The radio, a Yaesu VX-8DR, includes an AX.25 TNC, yet the specifications and manual only refer to this built-in TNC as a dedicated APRS device. Why can't it also be used with an external input, in the case of packet transceive that is not APRS-related, such that I wouldn't need to use an external TNC between my laptop and the radio?   Thanks in advance for any help.

I'm not that surprised, I've had similar responses to shareware type
donations.

Never the less, you've chipped in, perhaps others who are pro-digital but
anti DSTAR will follow your example.

There is no way that is going to happen. The Codec2 will not be compatible with AMBE, so a commercially manufactured transceiver will not be able to talk to an open one. D-Star does not have the capability to negotiate a CODEC in the protocol, so beside the low level of the coded the higher levels will also need to be redone.
There is no way the "proprietary technology can be replaced", the only thing that could happen is that a second network, incompatible with the current D-STAR network, could be setup using open technology.
Frankly, I don't think we still have the userbase to make that happen.

I am probably not the only one with this opinion, and I am not amazed that there are not many that would sponsor a development like this that cannot be put to real use.

The only useful development would be the development of a free, open codec that is compatible with AMBE. But that would have to be done in an environment that does not bow to US Patents etc, or it will have to wait until all the patents have expired.

I think hams should be looking into using TETRA instead of DSTAR/P25, if we
are to actually consider using digital voice technology.  I believe there
would be far fewer encumbrances than with P25, and there are LOTS more surplus
radios around.

Indeed... D-Star radios will always talk AMBE... and thier legality on
amateur bands will always be questionable.

Nothing stops however, someone coming up with an open system ... but
then say, modifying the D-Star gateway software to make *that*
interoperable with the aforementioned open system.

So yes, D-Star radios will be able to talk to some other digital radio
standard, but only through a repeater or translator of some
description.

I think there are lots of possible options for a low-bandwidth and
royalty-free CODEC. VoIP on slow links... digital voice on HF... just
to name two.

> The only useful development would be the development of a free, open

I'm not sure that "following the leader" is the way to go here. Yes,
if I wanted a Mickey Mouse-like character to use in a cartoon, I
could wait for Buena Vista's copyright on him to expire (lawyers
already managed to negotiate a 70-year expiry on the copyright). I
dare say AMBE will be locked down for at least several years yet.

The question is, do we want to sit around, or do we want to actively
seek our own. I personally have little money to contribute (don't
have PayPal... so that option is not open to me) but I will probably
have a look at it and see if there are other ways to help the cause.
However, like the original author of CODEC2, I have limited time too.

Summertime - and the living is easy except at the Packet Status Register offices where the editors are sweating over the next issue of TAPR's quarterly newsletter. In addition to producing perspiration, the editors are also seeking articles for the next issue of PSR. So if you have anything to contribute, please send it before the August 15 deadline.

No - I did not throw my clock out the window, but time is flying by nonetheless and the deadline for the next issue of TAPR's quarterly newsletter, PSR, is fast approaching (it's August 15). So, if you have anything that you wish to have see the light of day on the pages of PSR, please send it along ASAP.

I've picked up a handful of programs for various digital modes and driving my PC's soundcard with the line-out audio from my TenTec Omni 7 have no problem copying signals once I figure out what mode they are.

However, all these programs have either AFC or some other way of decoding a signal pretty much independent of what frequencies the tones are on, so long as they're inside the passband, so it doesn't matter a whole lot what frequency my receiver's tuned to.

On the other hand, I'm sure that if I ever get around to lashing things
up so that I could transmit, things wouldn't be so forgiving.

I haven't yet done any real research into digital modes; is there a good
(preferably online) resource, particularly something that would tell me
what the correct audio offset from the carrier is for the various modes?

The only "correct" audio offset is to keep it inside the band.

Most programs have a panoramic window, which if set up properly, will show
your actual receive frequency with audio offset and your transmit frequency.

See this one, for example:

I was thinking of the case where I've tuned another station and getting good print locally and then want to reply.

I'm using a transceiver in with the transmit & receive VFOs tuned to the same frequency.

Since the software will have grabbed and decoded his signal more or less automatically so long as I was tuned somewhere close. When transmitting, the software will presumably generate tones of some fixed frequency, completely ignorant of how I've tuned the receiver. There's no reason to think that if I transmit on whatever frequency my receiver happens to be sitting on that I'll be anywhere near where the other guy might be listening.

So, what's the trick to tuning digital signals so that I'm transmitting on the "right" frequency?

Or am I over analyzing this?

Yes, with any decent software you are.

Of all the signals in the receive passband, you need to select one to deal with.

When you do that, every program I've seen so far sets the transmit audio offset, i.e. the effective transmit frequency, to the received audio offset.

Assuming of course that both xmit and rcv VFO's are on the same frequency.

OK; that's an important piece of information. I had simply assumed that
the generated audio would be at some fixed frequency.

Thanks.

Digital QSO's normally take place on the same frequency for both sides, so
the transmitter audio offset has to match the receiver audio offset for it
to work.

The TAPR Office received a telephone inquiry today about the use of Packet Radio for relief efforts in Pakistan.

I asked Jeannie to summarize in an email what kind of information or help they were seeking

I felt posting to the tapr-announce list would be the easiest way to get the word out.

Please contact Jeannie directly if you can help.

73,
John, W9DDD

To recap, we are interested in HAM radio expertise to help us figure out how to enable on-the-ground reports communicated through HAM radio to be compiled into digital maps (e.g., see map created by Ushahidi for Haiti http://haiti.ushahidi.com/, which we fed SMS and Twitter messages) for use by relief organizations. This project is within Crisiscommons.org, (www.crisiscommons.org) and I am the Silicon Valley city lead. CrisisCommons.org is a volunteer movement of coders for humanitarian relief in natural disasters, and anyone can jump in and contribute any amount of effort that they like.

Background information and our current understanding is being recorded at:
http://wiki.crisiscommons.org/wiki/HAM_Radio_to_Digital#Self-Register
Please encourage any interested parties to jump in and edit the page to help us understand HAM capabilities and technical needs. The goals for defining requirements is to create an open source software stand-alone or add-on software to automate collection of HAM-generated information during natural disasters to a common operating picture.

A team is being sent in for a range of CrisisCommons.org projects; if your members could help us communicate with the HAM operators in Pakistan, to get requirements (even by voice), we would love to know more about what they need and how to help.

A working group will be running in Silicon Valley this Friday from 5-10pm, and we will have virtual participation. Details at:
http://www.eventbrite.com/myevent?eid=538771480

Please feel free to forward this email or advertise this project to your members - the more the merrier. We did send this information out to the contact form for the ARRL.

I look forward to any information that you are able to provide!

Best,

Jeannie

The September 1st deadline to register for the DCC and get the best room rates is fast approaching.

The DCC activities planning are in the final stages:

- The DCC Proceedings is over 200 pages! See the list of papers below.
- The speakers schedule is being planned.
- Introductory talks.
- Banquet Speaker
- The Sunday Seminar on DSP Tools, Techniques, and Tricks presented by Rick Muething, KN6KB (see below for abstract)
- Wonderful location at the Heathman Lodge, Vancouver, WA (http://www.heathmanlodge.com)

If you have not attended the DCC, you are missing out on a lot of technical fun. Papers, presentations, demos, meeting like minded people. It is a great event. Ask anyone who has attended one!

To register for the DCC go to http://www.tapr.org/dcc. Hotel registration information is also located there. Be sure to mention the DCC for the discounted rate.

See you at the 2010 DCC!

73, DCC Planning Committee.

Sunday Seminar

DSP Tools, Techniques, and Tricks

Rick Muething, KN6KB

Time: Sunday Sept 26, 8 AM �� 12 Noon

Prerequisites: An interest in Digital Signal Processing. Some experience in programming may be helpful. The only math you��ll need is addition, subtraction, multiplication and division and some idea of what a sine wave is.

Goals: The goal of the workshop is to encourage those peripherally interested in DSP to take the next step to learn what DSP can do and try some DSP design and coding. Each attendee will get a handout CD which will include all slides with links to useful references. The CD will also include some basic Windows VB.NET examples of operational code along with some useful DSP tools (demo versions).

Sessions: Four sessions 45 min each with 15 minute breaks.

1) DSP Intro and Basics: what we are trying to do with DSP. Why is it better/different than analog. The cornerstone of DSP .the Fourier Transform and the FFT.

2) DSP Tools: What you need to see, interpret and understand signals. Basic waveform processing utilities. How do you setup a sound card to capture and play back audio with examples. How to design basic DSP Filters using common tools.

3) DSP Techniques: How do we use DSP to do those things needed in a radio. Mixing, Filtering, Modulation, Demodulation, FSK, PSK, Tone Detection, AGC etc

4) DSP Tricks: Tricks of the trade to make the impractical possible. Common and useful tricks to make significant reductions in computer demands, Single tone detectors, decimation, windowing, CIC Filters, IQ sampling.

No seminar or workshop can cover this topic completely in a few hours but this workshop should remove some of the mystery of DSP and motivate those to learn what can be done and get more involved.

Bio: Rick is a retired entrepreneur electrical engineer and has been a ham since 1962. After volunteering for the Winlink Development effort in 1998 he focused his efforts on programming and DSP. Rick was responsible for the SCAMP, WINMOR and V4 sound card protocols described in the DCC 2004, 2008 and 2010 proceedings along with several of the software components of the Winlink 2000 system.

This is typically done automatically by the software for you.  Your
audio will be at the same tone as the receive if you are clicked onto
the receive waterfall, which you would be in order to receive the
station's data.  So, no changes in transmitter or software will be needed.

Of all the signals in the receive passband, you need to select one to deal with.When you do that, every program I've seen so far sets the transmit audiooffset, i.e. the effective transmit frequency, to the received audio offset.Assuming of course that both xmit and rcv VFO's are on the same frequency.This is typically done automatically by the software for you. Your audio will be at the same tone as the receive if you are clicked onto the receive waterfall, which you would be in order to receive the station's data. So, no changes in transmitter or software will be needed.

Maybe because it's a commercial standard and commercial standards
have nothing to do with Amateur radio?

 They seem to have a few reasons but I will leave  it to the anti-DStar
crowd to give them.

As for myself, it just isnt the sort of avenue I follow in the hobby but I'm
more than happy for others to.

It's a closed codec - you can't look at it, play with it, improve it or
adjust it.

In fact, being patented, it's ILLEGAL to do any of that.

Which means it's not amateur radio.

Hell, even the name is a registered trademark of Icom.

Ok but if you have bought a commercial transceiver for amateur radio,
can you look at or improve upon any part of it?

E.g. the firmware that is running on the microprocessor(s) that control it?

No, but by studying the interfaces and functions you could design your
own processor and firmware that would replace the original.

With D-STAR unless you buy the pre-programmed DSP chips or the DV
dongle you can't legally reimplement the AMBE codec at all, and that
makes it very different from other kit that implements unpatented modes.

This group seems as dead as the 2 Meter Packet Frequencies around here but I'll ask here anyway.

Is packet radio dead? Has the proliferation of Internet and Cell Phones made it so meaningless that no one is doing anything anymore?

I have been pretty much out of Ham Radio for a long time but now that retirement has reared it's ugly(?) head I find myself with time and a renewed interest.

I am monitoring all the 2 Meter Packet Freqs here (in the home of K3RLI) and hearing nothing. Not even the dubious DX Cluster traffic that used to go on around here!!

Is there any interest in old fashined packet radio any more or should I just put it all back in a box and relegate it to the cellar once more?

Oh yeah, Is Howie Goldstein, N2WX around here by any chance? I would still like to get a copy of the source for the "Howie Code" that ran in my DR-200's back in my digi-peating days. And a copy for the TNC-2 as well if there ever was one. I have always wanted to experiment with it and if packet is pretty much dead then there is probably no problem with me doing some stuff on two meters around here. Especially if I could find some kindred spirits who shared some of my interests.

Over here, classic packet radio and TCP/IP over packet radio are
completely dead. The only thing left is APRS on a single channel
on 2m and 70cm. There still are digipeaters optimized for APRS
and often with a connection to Internet, but all the NET/ROM nodes,
BBS systems, DX-clusters etc seem to be turned off.

Is that the KISS code or the original TNC2 firmware?

I should have the source for the KISS code somewhere, but I am not sure
if I can still get at it.   (it may be on backupmedia for which I no
longer have a drive connected)

By "over here" I assume you Europe, yes?

Actually, neither, althought I wouldn't mind having the original TNC2 source as well as what I want to play with will require changes to that code as well.

The "Howie Code" was a different kind of connection code much like NETROM but it actually preserved the originators callsign from end to end. It is what ran in the DR100 and DR200 digipeaters from PACCOMM. I ran a couple of them doing dual band gatewaying and providing rather extensive coverage from a mountaintop in New York (north of NYC) for several years in the early 80's. I always thought that it was never given a real chance to show its capabilities or develop.

I imagine everyone has a copy of the KISS source. :-)

My desire is to use software that already existed at the time the packet BBS's were coming into being. These other methods were never given any consideration either although I had some luck with my early experimentation. BUt ham radio has always suffered from a bad case of NIH syndrome which frequently results in a lot of effort being directed away from what might have been a very good solution to a problem. Of course, at this point it is all academic and little more than "proof of concept" experimentation. I see little liklihood that anything would revive packet radio even if it still has practical uses.

Yes, in particular the Netherlands.
In Germany I think there is something left.

Ok, I played with some TNC clones but as my main interest was with TCP/IP which had to use KISS mode, and KISS mode performed very poorly on busy channels (which we had in those days), we quickly formed a group and designed an SCC card with external modems, plus modem that worked with it. This meant the PC had full control over the radio and the TNC was no longer required. So I have little expertise on TNC firmware.

In those days I wrote software that emulated a TNC on a virtual COM port, so it was possible to run an early BBS (W0RLI, AA4RE) on our SCC cards. Later I wrote an emulator for the G8BPQ hostmode, allowing newer BBSes like F6FBB to run in multiuser mode. All the software ran on a single PC with DOS, Desqview (multitasker), QEMM (memory management) and performed as a NET/ROM node, IP router, BBS and DX cluster.

I did digipeating and played with IP quite a bit but it saw much resistance around here and I wasn't interested in playing politics. When I first moved back to Northeastern Pennsylvania my job was to put the first University (actually, the first anything) on the Internet. Gave me a lot of leeway. I had a connection between my house and the University that provided Internet access in the late 80's before was even one ISP. I used to love going to ham club meetingsd and listening to all the people discussing why it was technically impossible when I was already doing it. :-)

Yeah, there really were good old days. I always enjoyed ham radio more over there than here. And other than wanting to experiment with packet again I think I will be brushing up on my CW and will probably not even hook a microphone up to any of my rigs.

I think you mean PIxVRZ (PI1VRZ/PI8VRZ etc).
They have remained active very long but I think they are off the air.

Or you mean PA0VRC, a local amateur that has moved to another part
of the country but is still alive and kicking.
He built the local 2M repeater PI3PYR in 1977 or 1978 with some friends.

We had so many channels allocated to packet that it was possible to
separate the traffic. A channel for local chat, one for the BBS,
one or two for the access of the local node, and then separate channels
for the interlinking of all the nodes.
This was part of the reasons why TNC's were no way to go and we needed
those SCC cards. Larger systems typically had between 8 and 12 channels.

I had UUCP at work, and later when Linux became available also at home.
Internet came later (1994 or so) and was time-tariff so it was not so
attractive for radio related applications. Not to mention that it was
strictly forbidden to make a connection between amateur radio and the
telephone network.

Ah, probably stationed in Germany. We had a local airbase (Soesterberg)

here but it is now closed. I worked next to it for a couple of years
and remember the overflying F15s.

Nope, PA0VRZ from Apeldoorn. Bulletin station for "vereniging van radio-zend-amateurs". I used to copy the bulletins on RTTY and even talk with them once in a while.

Yeah, we had plenty of channels, too. But that never got in the way of politics. I started running IP on an unused frequency and still got complaints about it not belonging on ham radio. (And I probably shouldn't even go into the local Army MARS fiasco. :-)

UUCP is exactly what I was talking about. I was doing UUCP long before the Internet opened up to the public. I once ran UUCP between a couple TNC's to see how it would work and it wasn't bad. Basicly it already had email and Netnews so I had a hard time seeing what was accomplished by writing yet another BBS system (we had dozens of them on the phone as well, but they were never as well connected as UUCP.)

When I saw your call I had to run and take a quick look at my logbook.
But it was PE1CHS that I worked.  But, you never know!!!

Ok the VRZA clubstation.   It is now called PI4VRZ. They are active
weekly on saturdays (after the holiday break) 0900 UTC.
The main operator Ron PB0ANL was also active in the packet group that
ran PI1VRZ/PI8VRZ.
I listen to their bulletins weekly on 2M. You can also listen on
Internet at www.pi4vrz.nl

The problem was that UUCP ran on Unix, and Unix was an expensive system
requiring a high-end machine that only some lucky people had.
The average HAM had at most a 286 PC, and that was already in the
later years (1990), before that it was an 8088 system.
In those days I had an Atari ST (68000 system) and many packet users
had a Commodore 64.
In december 1992 I assembled a 386 system with 16MB memory, 800MB disk,
1024x768 graphics card and 17" monitor, paying about $3500 for it.
I installed Linux on it.   Then I could run UUCP from home!

> When I saw your call I had to run and take a quick look at my logbook.

He lived very close to here but I think he is no longer active.

PE1 calls are "technicians license" (no morse code) and originally
that meant "VHF-UHF only".   PE1CHS was a DX-er, maybe you worked him
while in Europe.
However, after 2002 or so (don't remember exactly) the morse code
requirement was dropped and all PE1 calls are now allowed to use
HF as well.
I have never been active on HF, but I have used amateur satellites
before I moved in 1995 and had to take down the yagi antennas.
Both SSB and packet satellites.

Bill-

I am over seven years into retirement, and my memory is getting a bit dim. I have an old PK-232 stashed somewhere. Many times I have thought about firing it up, but haven't found time yet. I would need to build some adapter cables first!

At one time I had 2 PacComm TNCs with "The Net" firmware, connected back-to-back between the 144 and 220 MHz bands.

I recently reprogrammed an old FM rig that had 441.000 MHz in it from back in the 90s. My notes indicate that was a Packet Backbone frequency. Sure enough, I can hear a steady chatter of packet signals there. I'm listening through a magnet mount antenna stuck to the top of some metal shelves, here in central Florida.

According to the FCC, N2WX renewed in May, and is living in Sarasota, FL. You might take a look at <http://www.tapr.org>. If you search their archives for N2WX, you will find several related articles. Their software library is at <http://www.tapr.org/software_library.php>.

I don't know if PacComm is still in business, but their website is on line at <http://www.paccomm.com>. A note at the bottom of the home page says "Last updated 7/19/2004".

I think Bill - what your problem is - is that you have walked away from
something and all of a sudden, you turn the radio on and you expect to
hear traffic, just like you did 10 - 20 years ago...

Up in the north, they pass traffic on two meters, at least as far as
Bingimton NY to Erie via Ridgeway PA, and they pass it as far south as
Pittsburgh PA - via the national traffic system.

The only person I know personally that is involved in Pete Carr - WW3O
You might have read one or more of his articles in QST Magazine.
I think Pete says they do it in the morning.
Not enough traffic anymore to sit there and do it all day.
I don't even know what kind of traffic they pass.
I think they only do it to keep the system up and running in case of a
emergency.

If you want people to participate with - I would tone down the
attitude...
There is still some good guys out there, but most of the old HAMS - pre
No Code - are DEAD, and the ones that still has the radios on are not
the same hams you remember from 20 - 30 years ago.

2 meters / 70 CM is unique band.
It is the first place you go when you get your license and the last
place you go before they take you to the rest home or the cemetary.
Most real hams won't even use any band that is channeltized...
You are going to find that the kids on the radio today are mostly the
walkie talkie crowd, who are not real hams, just want to be's.   Who
refuses to put up antenna's or buy transceivers or stand up to their old
lady to be able to put something in or on or outside of the house.

Sounds like you have been delegated into that crowd.

Your Advanced license tells volumes.
You knew about communications but didn't see any need to go beyond
Advanced and probably got mad when they eliminated Advanced and got rid
of the code...
That is the consensus of the population here....

Find yourself a Amateur Radio Club and get involved in Amateur Radio -
not just the walkie talkie crowd on the 565 simplex or the repeater
retards...
Get out the books and study and get your Amateur Extra license and
become a VE and give back to Amateur Radio - don't just take!

You will find, if you get involved - you will not feel so jilted and
will be less apt to retreat to the 75 and 160 meters, with the other
buddy clubs, where all they do is sit and cuss and not use their call
signs and act like they are still on the CB radio...

The lack of activity in this group may more reflect the death of Usenet than anything else. Very few Usenet sites exist outside of Universities and commercial providers these days.

There are still people experimenting with the Internet protocols (TCP/IP, etc) over ham radio. Little of it takes place at 1200 bps anymore; most folk are running 9600 bps or faster, some are using converted wireless equipment to achive multiple megabits ("HSMM"). And there is the new 56kb/s digital radio from the folks in the northwest. There are a lot of folks running Linux and many of these use the soundcard in their computer as the modem - no TNC required.

For more info, check out the Linux-Hams mailing list, the TAPR website <http://www.tapr.org> and the AMPRNet <http://www.ampr.org>.

I guess I was lucky, then. I had Unix (XENIX actually) on a M68K at
home from about 1984. Added more as time went on. We won'r even go
into what I have at home now but it ain't all PC's. :-)

And, of course, there were versions of UUCP for a lot of non-unix
computers in those days, too. MIght have even been one for CP/M.

I did. On 2 meters during one of the many VHF contests.

I used to do satellites, too. Might get back into that as well, but
it takes a lot more gear and a lot more money today. I worked mostly
the HF satellites inb those days especially the russian ones.

Great nostalgia. Talking with you brings back a lot of memories.

All the best.

Let's see, I have a TNC-1, a couple of TNC-2's, a KAM, a newer version
KAM, a PACCOMM 220, a couple DR-200's and even one of those early
VE-something or others that didn't do AX.25 because it hadn't been
invented yet. :-)

Like I said, I programmed all the 2 meter packet freqs into a scanner
and let it run all day yesterday and heard nothing. I guess if everything
has moved to vhf maybe the locals won't mind if I experiment on 2 meters
again. Hmmmmmm.... What ever happend to ROSE. There was another system
that showed promise but lost out to politics.

I have tried a couple of email addresses but never got an answer.
I really don't plan on calling his house.  I have asked this question
before in NetNews and other places.  I would have thought he would
have seen one of these requests or had someone mention that I was
looking for him.  Maybe he just dfoesn't want anyone to work with
his old code any more.

Yeah, PACCOMM is still there.  I have asked them three times now and
my reply each time was, "let me look and see if we still have a copy
of the code around anywhere."  That is usually the last I hear.  I
fear this is yet another piece of computing histoy that may have been
lost.

OK, on what frequencies? I'm in Scranton/Wilkes-Barre. When K3RLI was still active this place was a hot-bed of NTS traffic.

I haven't seen a QST in 20 years.

Oh, wait. You are talking about voice or CW. I would have thought that automated packet systems would have replaced that decades ago. But then maybe that's what "Not enough traffic anymore to sit there and do it all day." really means. :-)

Attitude? All I have said so far was 25 years ago politics kept any attempts at improving the system out and that ham radio suffered from NIH syndrome. Historical facts, not attitude.

And you accused me of having an attitude!!!

What are you talking about? I use mostly tube type HF equipment that

I build myself or at laest maintain myself. (When my father died he left a bunch of "newer" semiconductor and microprocessor based rigs behind. None of them still work.) i build antennas for the fun of it. Especially HF antennas. (Ever built a Sterba Curtain?) I alwys have ropes and wires hanging from trees around my property. I may have been out a long time, but I'm not dead.

>
> Your Advanced license tells volumes.

What is that supposed to mean? That was the level I had attained when I stopped using ham radio. Since getting interested I have started working on my Extra. Took the test once just to see what it was like and only missed it by 2 questions (on all the space stuff that didn't even exist when I was still active.) I expect to pass it before the summer is over.

Talk about being blinded by attitude. I was one of the advocates of eliminating the code over 20 years ago. Just because I do it doesn't mean I expect everyone to do it. I actually did 20WPM code for 10 years before I even had a ham licence. With the Army. That was also where I got my interest in RTTY, again long before becoming a ham.

I guess you totally missed the fact that what I wanted to do was get back into digital experimentation. Or the fact that I was doing wireless networking (both ham and non-ham) 30 years ago.

Gee.... That's where I thought it always was. (As one who used to
run a pretty good Usenet Site at a University until they turned me
off for "using too much bandwidth". :-)

Certainly haven't found any around here.

That was something I wanted to do. Wondered if one could change the
code in the box (I have a bunch of boxes with third party code based
on Linux available) to make them run AX.25. Seemed like one could
set up some pretty good high-speed point-to-point links with the WAP
boxes.

New as in different from the GRAPES stuff that was coming out about the
time I stopped having the time and money to play with it?

I've seen that, too. But end user devices was never my main interest
I was always much more interested in the backbone.

Not much on mailing lists. Been to the TAPR site but it basicly read
like 1990 all over again. But then, I didn't really get past the intro.
I'll check out th AMPR site.

Great talking to you again after all this time, Brian. Is Phil, KA9Q
still active out that way or is he too deep into the commercial stuff
anymore?

He's pretty much retired these days; I believe he's mostly into science education (speaking at high schools and junior colleges) these days.

Last time we had dinner a few months ago he was real excited by near-space balloon flights and using ham radio to relay video and telemetry. One of his high-school groups had just had a rather successful flight and collected some interesting data and video.

The HSMM folk have found that some brands of WAP can be told to operate in the ham bands (2.4 and 5.8 GHz) at increased power and are using them for high speed data links, both digital voice and data. And of course there are the D-Star folk with their medium-speed digital links. There is interest in Internet linking in both groups. A Google search on "HSMM" will probably yield some informative info.

I regret to say that the www.ampr.org site is rather sparse right now, as we just rebuilt it, but I hope to add more to it as the months go on.

Best wishes!

Thanks for the info. I will definitely look into some of this, especially
the WAP stuff as I have a bunch and really like playing with them.

If you see Phil again tell him I said "Hi" although I doubt he will even
remember who I am. (Not sayinghis memory is bad, just that I tend to be
that guy no one remembers. :-)

All the best to everyone on the left coast. It's been 25 years since
I was last that far west.

At some point it was decided that all club stations would have a
PI4 prefix, and the existing PA0 calls were changed to PI4.

PI prefixes with other digits are/were used for repeaters, nodes, bbses
and other special applications.

Later a vanity callsign system was introduced and now all prefixes
from PA to PH are used by radio amateurs, and PI for special stations.

Not having a HF license, I set up a azimuth/elevation controlled set
of crossed yagis and later added computer control. Convenient for
the low orbiting packet satellites (that no longer exist). My
station could completely automatically find the next satellite that
would pass (out of 6 or so that were active), turn the yagis, set
the frequencies of the transceivers, watch for the corresponding
callsign to appear on packet, and upload/download the files that
were queued. It was like satellite UUCP :-)
Neat to build it and to watch when it was all running... but boring
after a while.

Yes, great! It was a nice time and good memories remain.

Bill, good to have you back involved with Ham Radio. You'll find that thing=
s have changed, but there is a lot of exciting new things to have fun with.

Unlike some others, I don't sense any attitude other than "where are we now=
"? And that's a reasonable question. In PA and South NJ, APRS is the what's=
 hot now. There is some DSTAR activity, but in general, Packet Radio in any=
 given area is very sporadic and usually club-oriented.

Unlike the early 90's when we were all playing with Phil Karn's KA9Q, full-=
time connectivity to the Internet is the basis for support communications. =
DX cluster are mostly web-based, although you can connect to quite a few vi=
e Telnet. The biggest reason for the Internet is to write logging data to s=
ites like HRDlog.net or to map digital propogation via pskreporter or wsprn=
et.

So Ham Radio is a bit different with HF digital being the thing most highly=
 developed now with modes like JT65-HF, PSK31 and Olivia. Even RTTY has exp=
erienced a resurgence in interest. Amsat is suffering with most of it's mai=
nstay birds being off the air. QRP CW on the WARC bands like 30 and 17 is a=
 hot area, one that I enjoy quite a bit. SSB is the usual collection of wha=
t-have-you. Sometimes great, sometimes decidedly not.

But the main point being, there is a lot of digital activity being enjoyed =
on HF these days. It seems to be in sync with the connected, digital media =
world that we live in, so no real surprise. As for age? Yes the older Hams =
who got their starts in the late 50s are into retirement now and have moved=
```

into homes that may not support large antennas, so QRP and digital or CW a=
re their realm. Is there a reason to connect with a TNC on VHF anymore? Not=
 really.

Anyway, welcome back into the hobby. It may not be the same as you remember=
, but if you bought a Yaesu 817ND, ran it into a random wire via an LDG aut=
omatic tuner, and connected it to your PC via a West Mountain Rigblaster, y=
ou can have as much fun as I do on PSK31, JT65-HF or CW as I do.

The DCC is a done deal, so now is the time to put your thoughts about the DCC down on paper and submit them to the TAPR PSR desk for inclusion in the next issue of TAPR's quarterly newsletter. Photos are good, too, as well as anything else you wish to write that is ham radio digitally related.

The deadline for the next issue of PSR is October 15.

Thanks and 73,

Stan Horzepa, WA1LOU'
PSR Editor

REPORT TO THE FEDERAL COMMUNICATIONS COMMISSION ON EXPERIMENTS CONDUCTED BY PAUL NEWLAND AT AMATEUR RADIO STATION AD7I USING THE ERROR CORRECTING PROTOCOL DESCRIBED BY CCIR RECOMMENDATION 476-2

ABSTRACT

This report outlines the use of the teleprinter code described by CCIR Recommendation 476-2, also know as AMTOR, by amateur radio station AD7I. Use of this code during the period provided by Special Temporary Authorization (S.T.A.), file 7130, was hampered by external influences. No "scientific" data were collected but outstanding performance provided by the CCIR 476-2 coding was observed by the operator on numerous occasions. The report concludes with a recommendation that use of CCIR 476-2 coding by U.S.A. radio amateurs be allowed as soon as possible.

DISCUSSION

This report describes use of the error correcting protocol described by CCIR Recommendation 476-2 at my amateur radio station, AD7I, during the period of May 1982 to November 1982. During much of the experimental period, the High Frequency (HF) station was inoperative because of radio problems. Additionally, I was required by business commitments to make several unexpected and lengthy trips during the fall. Consequently, time did not permit scientific data, per se, to be collected for presentation. However, I have formed strong opinions about the usefulness of this mode of communications based on my use.

In May of this year I completed construction of a microprocessor system to convert the CCIR 476-2 signals to international telex teleprinter code.

The firmware to accomplish this code conversion was provided by Mr. Peter Martinez, G3PLX; I designed the controller to be software compatible with Mr. Martinez's firmware. An additional microprocessor system was designed and built by me using a different manufacturer's microprocessor. I programmed this second microprocessor to convert CCIR 476-2 Mode B to international telex teleprinter code. I also purchased a new HF-SSB radio to perform experiments with CCIR 476-2 coding. All other equipment was previously on hand.

After completing the controllers, U.S. Coast Guard and Canadian Coast Guard weather broadcasts were monitored to observe the print quality of Forward Error Correction (FEC) mode B communications during normal HF propagation conditions. In my opinion, without scientific data to back my claim, I feel that the FEC mode of operation for broadcast use is superior to that of conventional stop-start unprotected teleprinter transmissions (RTTY). A major advantage of CCIR 476-2 coding in FEC mode is that detected errors are converted to space characters by the code converter. Hence, errors are easily and quickly spotted by the operator so fills can be made from context.

On June 1, 1982, I advised the Commission's field office that on or after June 11, 1982, station AD7I would begin transmissions using CCIR 476-2. On June 13, 1982, contact was established with station TI3DJT using the

Automatic ReQuest for repeat (ARQ) mode A. From June 13 to 29, 1982, 39 contacts were made with radio amateurs around the world using CCIR 476-2 coding. Most of the contacts were made with ARQ mode A; only several contacts were made using FEC mode B. All contacts took place on or near 14.075 MHz. Stations with which communications took place were: TI3DJT, PA0RYS, HB9AUK, HB9AK, K4PA, G3PLX, A4XFW, G3RYS, KB6BT, KC7KK, and TI2CC. On June 30, 1982, the station's radio was returned to the manufacturer for repair under warranty. The synthesizer provided unreliable operation after the radio had been on for several hours.

On September 28, 1982, the radio was returned in good working order. >From September 28, 1982, to November 14, 1982, another 31 contacts were made. In my opinion, again without scientific data to back my claim, performance using CCIR 476-2 ARQ coding is VASTLY superior to conventional RTTY coding. CCIR 476-2 displays an amazing robustness during conditions of propagation that render SSB and CW modes of communications virtually useless. I apologize for not having scientific data to back my claims; I am sure that the data would substantiate my opinions. CCIR 476-2 consistently provided communications during short and long duration frequency selective fading, during SSB and CW co-channel and adjacent channel interference, and during conventional Radio Teleprinter (RTTY) interference. The only interference to which CCIR 476-2 is not immune, as one might expect, is another co-channel CCIR 476-2 station. Such stations did not present much of a problem during the test period. However, it is important to note that there were few stations available to cause inadvertent or deliberate interference.

IMPLEMENTATION

CCIR 476-2 proves to be a simple addition to an amateur radio HF RTTY station. Figure 1 shows how the system components were configured at station AD7I. The cost of the CCIR 476-2 code converter was about $40.00 due to a well-stocked junk box. If all components for the controller were purchased new and the firmware was free, the cost for a code converter should still be well under $85.00. This is a small amount of money compared to other system components. Vast sums should not be required to implement a

CCIR 476-2 code converter.

CONCLUSION

The performance provided by CCIR 476-2 coding is superior to conventional coding, and the incremental cost to add that capability to an amateur radio RTTY station is low. I therefore recommend that the Federal Communications Commission allow, as soon as possible, the use of CCIR 476-2 coding by radio amateurs who now have RTTY privileges.

Respectfully submitted,

Paul Newland, licensee of

Dear Paul:

In the spring of this year at the packet radio meeting held in Murray Hill, you and I discussed some of the regulatory problems facing the development of a high frequency data network. One key problem was the legality of running a H.F. packet station in unattended mode, where unattended implies operation of a radio without a control operator present during transmissions. Without releasing amateurs from the requirement that all H.F. transmissions must be supervised by an operator, automated H.F. networks are impossible to achieve.

On July 7, 1982, I made a request of the F.C.C. to allow operation of my station, using the error correcting teleprinter code know as AMTOR, without a control operator being present. I was delighted on November 19, 1982, with a positive response from the F.C.C. Although not everything I requested was allowed, I was pleased to find that I got more than I thought I would. I can now run unattended on H.F. with AMTOR.

I encourage everyone involved with the establishment of automated data networks using H.F. to seek waivers of the rules, as required, to permit the rapid and continual growth of this technology. Amateur Radio is progressing!

With  enough power and weak signal modes you can use the geostationary
broadcast satellites as passive reflectors .

LOCAL AREA NETWORKS VIA PACKET RADIO MEDIUM

Den Connors

University Computer Center
University of Arizona, Tucson, Arizona

Abstract

Investigations are underway by the Amateur Radio community to incorporate digital communications techniques into the Amateur Service. The network system utilizes simple techniques, using normal terminals and personal computers, and a wide variety of amateur radio transceivers. Complete local area network protocols are realized by incorporating a micro-processor based interface unit to connect the terminal device and radio. Physical-level protocol involves half-duplex transmissions with frequency-modulated transceivers. Channel activity is sensed by the packet radio, and negative acknowledgement used to determine if retransmission of lost packets is required. A data-link control is also implemented, and two connecting protocols are being tested on top of these lower levels. The TAPR/AMSAT protocol provides multiple point-to-point connections on the channel. The TAPR/DA (dynamic-addressing) protocol implements a full datagram network, and uses a robust network control scheme to provide near-optimum channel utilization and network tolerance

to a number of error conditions related to open radio channels.

Introduction

The Tucson Amateur Packet Radio group is currently coordinating a series of tests with Amateur Radio operators in eighteen major U.S. cities, to investigate the use of digital computer and terminal communications using packet radio techniques. Initial investigations are being performed on the Amateur Radio Service VHF bands, using half-duplex transmissions. Two sets of experiments are being undertaken; the first is testing multiple simultaneous connections on a single shared frequency, while the second tests a new form of efficient radio frequency local area network.

A general description of the system is given in terms of the signals and medium access. This is followed by information on the hardware implementation. A more detailed description of the signalling technique, data link protocol and the two types of link and network protocols are described.

Physical and Medium Access Protocols

Both protocol tests are using a common medium. Access to the radio channel is accomplished using audio frequency shift keying within the normal audio communications passband. The packet radios are able to detect digital communications on the channel, and will defer transmissions while there is activity on the channel. Collisions, interference and unusual conditions (fading, multipath, etc.) which cause unsuccessful transmissions will result in no acknowledgement, and an automatic retransmission will result after a set delay. Multiple unsuccessful transmissions will produce an error indication at the data source. Successful transmissions will result in an acknowledgement being transmitted to the originating station. The acknowledgements may occur after each packet, or may be deferred for up to seven packets, using standard high-level bit-oriented data link protocol (HDLC), implemented with large-scale integrated circuitry.

This multiple-access protocol is therefore based on on-channel data sensing, with negative acknowledgement causing retransmission (data-sensed multiple-access with collision-detection by negative acknowledgement, or DSMA/NAK). It should be noted that the normal LAN technique of carrier-sensing is not appropriate to the Amateur Radio Service, where all manner of signals are apt to impinge on the data channel. Use of much less occupied bands is possible, and conversion to carrier-sensing trivial. However, the choice of using the more heavily-used bands was made to provide exposure to the general population, and promote acceptance of this new mode.

Hardware

The Tucson Amateur Packet Radio Corporation (TAPR) has created a single-board packet radio terminal node controller (TNC) which interfaces standard microcomputers or data terminals to commonly available Amateur Radio transceivers.

Initial investigations in Tucson are using the two-meter band (144-148MHz), and both this band and others will be used in the other seventeen test sites. This band was chosen for maximum visibility within the Amateur community.

The transceiver interface is performed without modification to the unit by using the three normally-available signal lines; audio input (microphone), audio out (speaker) and transmit (push-to-talk). This ease of equipment configuration was the primary reason to use audio-frequency shift keying, and to keep the modulating signals within the audio passband.

The digital data from the terminal or computer is fed to the packet radio interface board either through a standard RS-232 serial interface port, or by using a custom parallel interface. TTL-level lines are provided on the board for these connections, and a wire-wrap area is also included for non-standard interconnects.

The TNC accepts the serial or parallel data and formats the data into packets, using the standard HDLC format as described below. These serial packets are encoded using a non-return-to-zero inverted (NRZI) code to assist in providing an audio signal for the demodulator to lock on, using phase-locked loops. This NRZI data is presented to the audio FSK modulator, and the modulated signal is fed to the audio input of the transceiver.

The received signal appears as an AFSK signal on the audio output of the radio. A side benefit of using standard Amateur radios is the availability of a speaker for monitoring the channel while the experiments are in progress, although experience suggests that continued monitoring can be most distracting.

The signalling tones used to modulate the radio were chosen to be compatible with those of the Bell 202 half-duplex modem set of standards. This was done both to use a well-tested pair of frequencies with much operating experience, and to allow earlier experimenters with surplus 202-type modems to use their equipment, expanding the size of the test community. The main drawback to the 202-type modem is the limitation of 1200 bits/second of data transmission. Further experimentation is planned for higher-speed phase-shift keying modems within radios built expressly for packet radio service.

Hardware also exists on board to handle packet encoding and decoding, buffering, and system initialization and calibration. All components necessary to provide the channel access and data link control, as well as network protocol, are also contained on the TNC. A built-in modem and power supply minimize the complexity of installation.

Data Link Control

Both protocols being investigated use similar data-link protocols, although there are differences in addressing modes. An HDLC controller integrated circuit provides most of the circuitry for building and disassembling the packets. HDLC framing signals, address bytes, control byte and trailing cyclic redundancy check bytes are employed without modification. Successful packets are acknowledged on receipt, using standard HDLC control modes. Each packet is checked for correct CRC calculation, and the acknowledgement packet is withheld if the CRC is incorrect. This forces a retransmission by the source station. Retransmitted packets are thereby forced either by incorrect CRC calculation or by having been interfered with (collisions or unwanted signals). Collisions of packets are minimized by the data-sensing capabilities of the packet radios.

The decision of the next time to retransmit a packet will be weighted by a binary-exponent random back-off algorithm, similar to that used by Ethernet-like systems. This minimizes the possibility of continuing collisions by radios with nearly-synchronous retransmission attempts.

Unlike most LAN media, the open radio channel susceptibility to intentional and unintentional interference adds complexity to the link-level algorithms used to reschedule transmissions. Another problem is the phenomenon of "capture" of the receiver demodulator by FM signals stronger than that of the desired signal.

Connection-Oriented Protocol

The first protocol used to exercise the packet radio system was one developed simultaneously by groups in the Los Angeles and Washington, D.C. areas, and approved and "standardized" at a meeting sponsored by the Radio Amateur Satellite Corporation (AMSAT) in October of 1982. The implementation of this TAPR/AMSAT protocol provides a means of connecting pairs of packet radios with a communication channel transparent to other users of the shared channel. While lacking some of the capabilities of a full local area network, this protocol nonetheless provides a means of experimenting with channel capacity, access algorithms and system parameters.

The TAPR/AMSAT implementation provides the same types of functions as the link-access protocol of X.25. Connection and disconnection, error indications and control, and flow control are all provided. Virtual circuits are supported on the channel and channel-wide monitoring is available.

The addressing scheme is unique, in that the Amateur Radio Service has associated with each station a single call sign, that of the station owner/operator. The packet radios have made use of this uniqueness to provide unambiguous addressing, both within LAN's and across future internetwork gateways. A serious drawback is the requirement of seven bytes for both sending and receiving addresses, but on the half-duplex channels currently in use, this added overhead is not noticeable.

A further enhancement allows extension of the network to larger geographical areas with any of the stations acting as a store-and-forward packet repeater. Stations requiring repeat services use bits in the HDLC control word to signal the need to have a message repeated, and repeated messages turn off this bit to prevent possible multiple acknowledgements.

Although this protocol is designed primarily for point-to-point links within a larger multi-point network configuration, it does lend itself well to some of the needs of the shared-channel packet system, including terminal-to-host and host-to-host connections.

Datagram Protocol with Dynamic Addressing

The second protocol being used in the packet radio experiment test beds has a more efficient addressing scheme, providing each station with a mechanism to obtain a one-byte address when first accessing the network. This dynamic-addressing protocol, called TAPR/ DA, provides a full network configuration with connectionless protocol and a centralized, failure-tolerant network control mechanism.

The unique aspect of this LAN protocol is this utilization of dynamic address allocation. A network control station (NCS) monitors for stations attempting to sign on, and replaces the amateur radio call sign sent to the NCS with a single byte address for efficiency. Each station then has available from the NCS a list of users (amateur call signs) and corresponding assigned addresses. This list is the system status table. For robustness and ease of switching to other radio channels, the first station on any given frequency will automatically be chosen as the NCS, and in the event of loss of this station, the next station attempting transmissions which require the NCS will become the NCS.

This protocol also supports a store-and-forward repeat capability. The possibility of hearing stations in a different network geographically remote, but using the same frequency requires special algorithms. The conditions of multiple store-and-forward digipeaters, network control stations or identically-addressed stations must be detected and corrected.

Future Research

Currently experiments are underway to further extend network topology through the use of specified stations as network-to-network links, using separate radio channels. Additionally, the use of amateur radio satellites is being planned.

BLACK THURSDAY

All was going well. The parts were in hand, PC boards delivered and volunteer (slave) labor lined up for the BIG PUSH -- would you believe Beta TNCs in time for Christmas?

Neither would Murphy! On Wednesday, 8 December 1982, the first TNCs were delivered to TAPR from one of the two assembly plants. The first one worked perfectly! Unfortunately, by 2:00 AM, Thursday, 9 December, a serious problem was very apparent. "Black Thursday" was upon us. Only 3 of the first 19 TNCs were functional.

After a fitful (morning's) rest, an emergency meeting of the TAPR executives was called, production halted, and an investigation into Murphy's doings launched.

It turned out that there was a problem in the plate-through job on the PC boards, meaning that the top half and the bottom half of the board were intermittently (dis)connected. The 119 TNCs assembled by the time of the halt in production were sent to the scrap bin, and an assessment of the damages made. The losses were a staggering $8600!

TAPR, being in no position to absorb such a blow, determined to finish the project anyway. A salvage operation was mounted, and in the end there is a $3000 loss to contend with -- not insubstantial, but one that, with a judicious amount of finagling, and some voluntary $upport from those interested in seeing this thing through, can be overcome. New boards were ordered fabricated (free) and parts to populate the boards re-ordered.

After a few slips in the schedule, 10 boards were received the week of 28 December 1982. Two were hand-assembled by WA7GXD, and worked the first time. Three were assembled by one of the two assembly plants, wave-soldered and delivered. All three worked!

The delay time was used by both the software group, for additional debugging and refinement, and the hardware group, for additional testing and interfacing. Meanwhile, the approximately 70-page TNC Manual is being edited and clarified.

The present schedule calls for board assembly to begin the week of 9 January with assemblies delivered to TAPR late in the week of 16 January. The boards will then be powered up and power supply voltages checked. Passing this test, the ICs will be loaded and calibration performed on the MODEM. Finally, the TNC will "connect" to itself via a digipeater, then be packed up, along with the manual, for shipment to the Beta coordinator. The Beta coordinator will then be responsible for distribution of the TNCs to the individual site participants.

It has often been asked if the TAPR TNCs will be compatible with the Vancouver TNCs, and the answer is an emphatic YES! Harold Price, NK6K and co-author of the high-level PASCAL software, established a connection with Skip Hanson, WB6YMH, in Los Angeles on 8 January 1983. Harold was using a Beta TNC, while Skip used a VADCG TNC. Packets were exchanged for a half-hour or so, and the test was a complete success!

The initial software released with the Beta boards is a version of the AMSAT protocol agreed upon in Washington DC the weekend of October 8th, in addition to the more-or-less standard Vancouver protocol in general use. The software is outlined in more detail below.

SOFTWARE UPDATE

This update would be written by Margaret, KV7D, rather than by me (KV7B), except that as these words are being composed she is putting the last bells and whistles in the TAPR/AMSAT AX.25 level 2 protocol software which will appear on the TAPR Beta board at time of distribution. The people responsible for this monumental effort are: Dave Henderson, KD4NL, who was responsible for implementing the protocol; Margaret Morrison, KV7D, who put together the entire package of real-time assembly language routines and debugger; and Harold Price, NK6K, who built the extremely flexible command parsing language. Of the 24k bytes of PROM on board, 22k are used in this release. The high-level routines were written in compiled Pascal, and occupy about 16k of the total. The entire development time was roughly from the AX.25 protocol meeting in October until today (mid-January).

The simplest description of the software is that it's everything any of us dared to hope for and more. Not only does it implement AX.25 level 2 protocol "by the book," (it follows the October 10 document produced at the AMSAT meeting, based on the AMRAD recommendations; and where ambiguities exist, follows Ma Bell's BX.25, issue 2 document), but it can also operate in Vancouver compatibility mode with no problems.

Present at this time are some 66 user settable parameters for controlling the behavior of the board, many of them for determining the details of terminal communication. In this short space only a few highlights may be mentioned, but they include such items as hardware and software flow control, separately controllable in either direction, with the software flow control characters being user definable. In order to permit total transparency a single command defeats all special character traps and packetizes according to timer and packet length criteria. At the other extreme, input editing at the character and line level are available, including a separate "cancel packet" command.

Perhaps the most important features are the elaborate timer operated CSMA procedures, including (all user settable) separate key-up delays for digipeating and originating packets, separate delays for voice repeater key-up and tail-drop times, and random wait times after collisions. Flow control on the RF link also involves time delays. Altogether, there are ten distinct timer functions associated with the RF link, requiring 4 separate clocks to be maintained by the interrupt driven routines.

All in all, the functions presently on board should be more than adequate for the "shakedown cruise" coming up during Beta Test, and future releases will have even more features (we've still got 2k PROM to go before adding the next deck to the board!).

On January 16th, we moved the TAPR internet server to new hardware. Hopefully the mail, mailing list, web, and ftp services will operate just like they did before, though the IP address has changed and it may take a day or so for the new data to make it to all the name servers.

The svn service is still running on the old machine and IP address; it will be moved in the next couple of days.

In the process of the move, we may have lost about a weeks worth of mailing list archives. We'll see if we can reconstruct the archive, but it may not be practical. Sorry about that. Some subscription updates may also have been lost.

Some fine-tuning continues so we apologize in advance for any hiccups you see over the next few days.

Jeremy McDermond stepped in on short notice to manage the transition, and did a great job. Thanks, Jeremy!

73,
John N8UR

Jan 14,1983 -- The Radio Amateur Satellite Corp. (AMSAT) and the Volunteers In Technical Assistance (VITA) {note -- pronounce as VI-TAH as in the word vital} have today announced their intent to pursue a joint effort to develop a low-cost packet radio satellite system called PACSAT.

VITA, headquartered in Rosslyn, VA, is a private, nonprofit organization that supports people working on technical problems in developing countries with technical information provided by thousands of volunteer scientists, engineers and technologists. The information and assistance VITA provides is aimed at helping local people in developing countries to select and implement technologies appropriate to their local situations.

VITA Director Henry Norman and VITA Project Coordinator Dr. Gary Garriott (WA9FMQ) today announced that VITA has just awarded AMSAT a $15,000 Design Definition Grant to support development of PACSAT as a reliable low-cost digital satellite system to meet requirements for communications of technical information on renewable energy resources to and from their many field locations. AMSAT's role in this joint activity will be to provide hardware suitable for demonstration programs and to provide technical assistance in developing a low-cost system. Part of this effort will involve adapting solar power, amateur radio and personal computer technology for use in the field, far removed from any technical support.

AMSAT's PACSAT project manager Den Connors (KD2S) indicated that this grant will support initial PACSAT design definition activities which are being coordinated by AMSAT with work being done in some 15 locations around the world.

It is also of interest to note that WA9FMQ is a cousin of NASA astronaut Dr. Owen Garriott, W5LFL who may be amateur radio's first "space mobile" by operating from the Space Shuttle if a proposal submitted by AMSAT and ARRL is approved by NASA.

We received some excellent articles for the next issue of PSR (Packet Status Register), TAPR's quarterly newsletter, but there is always room for one more! The editorial staff will be putting the next issue together during the next few weeks, but if you have anything you would like to add, please send it along and we will make sure it gets in.

Thanks and 73,

HamRadioNow: GNU Radio Intro (from the DCC); Tale of Two Hamfests

Posted: 19 Jan 2013 08:55 AM PST
http://hamradionow.tv

Episode 51: Introduction to GNU Radio

The four-hour "deep dive" from the DCC

The GNU Radio Project is a development and experimentation platform for the software behind Software Defined Radio.Tom Rondeau KB3UKZ is the project leader, and he presents this four-hour talk as the Sunday Seminar from the 2012 ARRL & TAPR Digital Communications Conference, held last September in Atlanta.

Episode 52: A Tale of Two... Three Hamfests

Sunday Is Dead. Long Live Friday! As more hamfests abandon Sunday in favor of Friday, Gary talks to the chairmen of two of them – the newly reborn Miami Hamfest (aka Tropical Hamboree), and Charlotte. Then he dissects the Shelby NC hamfests's move back to the county fairgrounds they abandoned five years ago. Let the Hamfest Season begin!

HAMRADIONOW EPISODES 59 thru 63: Online Now

59 covers RFinder, a new online repeater directory with apps for iOS and Android, and integration to RP's programming software. My quick tests worked well, but beware the outdated info that plagues all directories.

60 is a talk with ARRL COO Harold Kramer WJ1B on plans for the upcoming Centennial, particularly the National Convention to be held in Hartford in July, 2014.

61 starts the SDR Marathon. We talk to FlexRadio's Greg Jurrens K5GJ. Sure, lots of Flex product info, but also a lot of basic info about what Software Defined Radio is (and isn't).

62 and 63 are from the ARVN Archives, programs previously available only on DVD. Each episode comes in 3 parts of about an hour each.

62 is Phil Harman VK6APH's talk about designing the HPSDR Mercury receiver, the first direct-conversion SDR in Amateur Radio. It was the Sunday Seminar at the 2008 ARRL & TAPR DCC in Chicago. The second one? The Flex 6000 series. They go from antenna to A/D converter with no active components in between (maybe just a bandpass filter).

63 is the SDR Forum from the 2009 Dayton Hamvention®. Six SDR heavyweights cover the future, contesting, Flex, Elecraft, HPSDR, and operating the stuff.

We've got several more interviews to edit from the Orlando HamCation... coming soon, so stay tuned!

>Newsgroups: net.ham-radio, net.space
>Date: Fri Mar 25 16:24:07 1983

Last weekend, JAMSAT and JARL (the Japanese branch of AMSAT and the Japanese Amateur Radio League) formally announced a project to build an amateur radio satellite for launch in 1986 aboard a new Japanese launch vehicle, the H-1 (similar to the American Delta).

The satellite will physically resemble Oscar-8, and carry two communications payloads. One will be a Mode J 2m-to-70cm linear transponder like that on Oscar-8, and the other will be a digital store-and-forward "mailbox".

The digital half of JAS-1 will be in addition to the similar PACSAT project being planned in the US for one of three launch possibilities: aboard a Space Services launcher, a Delta with Landsat D', or aboard the Landsat 4 Recovery shuttle mission from Vandenburg.

Discussions have been underway between AMSAT and JAMSAT for some time to establish common modulation, protocols and user interfaces wherever possible for PACSAT and the digital portion of JAS-1 in order to minimize user inconvenience.

Launch of JAS-1 is planned for early 1986 into a 1500 km altitude, 50 degree inclination orbit. Note that this orbit will NOT be sun-synchronous, unlike that planned for PACSAT.

Phil Karn, KA9Q
Asst. VP Engineering, AMSAT

I still have my JAS-1 modem (combined with an early TNC2 clone)
and a printout of a session with the mailbox...

AX.25 LEVEL 2 PROTOCOL

Terry Fox, WB4JFI
Vice-President, AMRAD

Abstract

This paper contains the latest draft of the AX.25 protocol specification. This is the first public release of this draft. Earlier drafts have been given to specific inviduals for comment and as a reference for software development. Changes should be expected. Please check the AMRAD Newsletter for announcements of later versions.

History

Over the years there have been several protocols suggested for use at layer 2 of the ISO Open System Interface Reference Model (OSI-RM) over Amateur Radio. The one system that has been in use is based on the IBM SDLC protocol, and it has been working as far as it went. One of the immediate problems that came up with SDLC was that its address field of SDLC is very limited (being one byte long), causing problems if there are many amateurs on at a time.

Trying to come up with a protocol that everyone would agree to seemed like an almost impossible task a year ago. What we at AMRAD decided to do was to go over the various protocols in use or available to the amateur, figure out the best and worst parts of each protocol and see if the proto col could be "enhanced" to work properly over the amateur radio enviroment. After reviewing the various protocols around and talking with people in the computer networking industry, we decided to push the X.25 standard, modified to allow a larger address field. At about this time, a group of amateurs in New Jersey were coming to the same conclusion, so about mid-June of 1982 the two groups got together and after two weekends came to an "understanding" on a level 2 protocol. The most delicate part of the negotiations between the two groups concerned the name to be given this protocol. In order to not step on anyones toes, it was decided to call the protocol AX.25, which stands for Amateur X.25.

The next step in the evolvement of AX.25 was that in October of 1982, AMSAT hosted a gathering of some of the leaders in amateur packet radio. AMRAD was at the meeting, along with representatives from TAPR, SLAPR, AMSAT, and PPRS. Three days of intense discussion followed, and an agreement was finally reached on a nation-wide compatible protocol. AX.25 was then modified to be compatible with this new protocol (basically the only major changes were an additional extension of the address field, and the addition of a Protocol IDentifier, or PID field).

The rest of this paper will describe the basics of the AX.25 level 2 protocol.

AX.25 Layer 2 Protocol Specifcation

This protocol conforms with the ISO Recommendations 3309, 4335 (including DAD 1&2) and 6256 high-level data link control (HDLC) and uses some terminology found in these documents.

This protocol also conforms with ANSI X3.66, describing ADCCP, balanced mode.

This protocol is written to work equally well in either half- or full-duplex amateur radio viroments.

This protocol has been written to work equally well for either point-to-point connections, or connections made thru a larger device, such as a metropolitan network controller (MNC).

This protocol does allow the establishment of more than one layer 2 (link layer) connection per device, if the device is so capable.

This protocol also follows in principle the CCITT X.25 recommendation, with the exception of an extended address field and the addition of the Unnumbered Information (UI) frame.

Most layer 2 protocols assume that one large device (generally called a DCE, or data circuit-terminating equipment) is connected to several smaller devices (usually called a DTE, or data terminating equipment). AX.25 assumes that both ends of the link are balanced, thereby eliminating the two different classes of device.

Frame_Structure

Level 2 packet-radio transmissions are sent in small blocks, called frames. These frames are made up of smaller parts, called fields. Fig. 1 shows how the three types of frames are made up. Fig. 1 shows the frames in the same bit order that most packet articles show them. Unfortunately, this method has led to some confusion, since the least-significant bit (LSB) is to the left rather than to the right, as most people would ordinarily assume. I am pointing this out early in this paper to prevent mass confusion as I progress. Later on, I will switch to a hopefully more understandable way of showing the frame ans its components.

Field_Definitions

The frame is made up of several parts, called fields. Each of these fields is made up of an integral number of octets (or bytes), and serves a specific function.

Flag_Field

Since amateur packet radio is a bit-oriented protocol, the only way to tell when one frame is over and another is starting for sure is to delimit each frame with a certain bit sequence both at the beginning and the end. This is the job of the flag field. A flag consists of a zero followed by six ones followed by another zero, or 01111110 (7E hex). Due to the bit stuffing mentioned above, the only time this sequence is allowed is at the beginning and end of a legitimate frame.

Address_Field

The address field is used to identify both where the frame came from and what the destination of it is. In the CCITT recommendation X.25, this field is only one octet long. This permits at most 256 users per level 2 channel, and since some bits of this field were used for other purposes, the real number of users were about thirty per level 2 channel. Both the HDLC and ADCCP recommendations allowed the address field to be extended, so we decided to extend the address field per their recommendations in the amateur version of X.25 to include the callsigns of both the destination and source amateur radio stations.

The method used to extend the address field will be described shortly.

Control_Field

The control field is used to identify the type of frame and control several attributes of the level 2 connection. It is one octet in length, and its encoding will be discussed in a following section.

PID-Field

The Protocol Identifier (PID) field is used only in information frames, and identifies what kind of layer 3 protocol, if any, is in use. Its encoding is as follows:

```
M      L
S      S
B      B
xx00xxxx  Reserved at the moment.
xx01yyyy  AX.25 layer 3 implemented.
xx10yyyy  AX.25 layer 3 implemented.
11110000  No layer 3 implemented.
11111111  Escape character.  Next byte
          contains more PID information.
```

Where:

1. An x indicates a "don't care" bit.
2. A y indicates all combinations used.

Information_Field

The information field is used to convey the actual user data from one end of the link to the other. I fields are allowed in only three tyes of frames, the I frame, the UI frame, and the FRMR frame. The I field can be up to 256 octets long, and should be an even multiple of octets long. Any information in the I field should be passed along the link totally transparently, except for any zero-bit insertion necessary to prevent flags from accidentally appearing in the I field.

Frame_Check_Sequence

The frame-check sequence is a sixteen-bit number calculated by both the sender and receiver of a frame. It is used to make sure that the frame was not corrupted by the medium used to get the frame from the sender to the receiver. It is calculated in accordance with ISO 3309 (HDLC) recommendations.

Bit_Stuffing

In order to assure that the flag sequence mentioned above doesn't accidentially appear any where else in a frame, as the frame is being sent it should be monitored, and if more than five contiguous ones are detected, a zero bit should be added between the fifth and sixth ones, eliminating the possibility of a flag appearing in the frame other than where it belongs. The receiver of five ones, a zero, and more ones should automatically eliminate the inserted zero before passing the data on.

Bit_Order_of_Transmission

With the exception of the FCS field, all other fields in an AX.25 frame should be sent starting with the least-significant bit. In accordance with HDLC practices, the FCS should be sent most-significant bit first.

Frame_Abort

If a frame must be prematurely aborted, at least fifteen contiguous ones should be sent with no bit stuffing added.

Invalid_Frames

Any frame consisting of less than 136 bits, or not bounded by opening and closing flags, or not octet aligned (an integral number of octets) should be considered an invalid frame by the link layer.

Address_Field_Encoding

The address field of all frames should be encoded with both the destination and source amateur callsigns of the frame. If a level 2 amateur "repeater" is to be used, its callsign should also be in the address field. AX.25 follows the HDLC recommended method of extending the address field in order to fit all this information into the address field.

Basically, the way the HDLC address field is extended beyond one octet is to reserve the least-significant bit of each octet for what is called an "extender bit". This bit is set to zero if the next octet contains more address field information, and is set to one if this is the last octet.

To make room for this extender bit, the amateur radio call sign information is shifted one bit to the left.

The actual encoding techniques for both non-repeater and repeater operation follows.

Non-Repeater_Address-Field_Encoding

If a level 2 repeater is not being used, the address field is encoded as shown in Fig. 2. The destination address is the call sign of the amateur radio station that the frame is addressed to, while the source address contains the amateur call sign who sent the frame. These call signs are the call signs of the two ends of a level 2 AX.25 link only, not of any other station, such as the destination of a packet going thru an intermediary link. Those addresses should be in a higher layer, not layer 2.

A1 thru A14 are the fourteen octets that make up the two address sub-fields of the address field. The destination sub-address is seven octets long (A1 thru A7), and is sent first. This will allow the receivers of the frame time to check the destination address sub-field and see if the frame is for them while the rest of the frame is being received. The source address sub-field is then sent in octets A8 thru A14. Both of these sub-fields are encoded in the same manner, except for the last octet having the HDLC address extender bit set. Since they are basically the same, only the destination sub-address will be outlined.

There is an extra octet at the end of each address sub-field that allows room for a Secondary-Station Identifier (SSID) and three additional bits for future expansion. The SSID field allows an Amateur Radio operator to have more than one packet radio station. This is useful when an amateur wants to put up a repeater in addition to his regular station for example.

Appendix A shows a typical AX.25 frame in the non-repeater mode.

Destination Sub-Field Encoding

Fig. 3 shows how an amateur call sign is placed in the destination address sub-field, occupying octets A1 thru A7.

Octet	ASCII	Bin.Data	Hex Data
A1	W	10101110	AE
A2	B	10000100	84
A3	4	01101000	68
A4	J	10010100	94

A6	I	10010010	92
A7	SSID	0RRSSID0	

Bit Position--> 76543210

Fig. 3. Destination Field Encoding

Where:

1. The top octet (A1) is the first octet sent (sort of like popping it off the top of the stack), with bit 0 of each octet being the first bit sent, and bit 7 being the last bit sent.

2. The first (low order or bit 0) bit of each octet is the HDLC extender bit, which is set to zero on all but the last octet in the address field, where it is set to one.

3. The bits marked "R" are reserved bits. they may be used in an agreed upon manner in individual networks. If they aren't implemented, they should be set to one.

4. The characters of the callsign should be standard seven-bit ASCII (upper case only) before being shifted left to make room for the extender bit. If the callsign is less than six characters long, it should be padded at the trailing end with ASCII spaces between the end of the callsign and the SSID octet.

5. The SSID portion of the last octet has been intentionally left vague at this point, and is left up to the individual station to assign. The only recommended restriction is to reserve the all-one condition (1111) for an all-call SSID in case one wants to reach an amateur but dooesn't know what SSID that amateur

operates under.

Level_2_Repeater_Address-Field_Encoding

If a frame is to go thru a level 2 amateur packet repeater, there is an additional address sub-field added to the end of the address field. This additional sub-field contains the call sign of the repeater to be used. This will allow more than one repeater to share the same rf channel, which has been a problem with the older protocols. If this field exists, the last octet of the source sub-field has its extender bit set to zero, indicating that more address-field data follows. The repeater address sub-field is encoded in the same manner as the destination and source address sub-fields, except for one bit in the last octet, called the "H" bit. The H bit is used to indicate whether a frame has been repeated or not. This is necessary to prevent someone from potentially receiving two identical frames, the one going to the repeater, and the one coming back from the repeater. Fig. 4 shows how the repeater address sub-field is encoded. Appendix B is an example of a complete frame on its way back from a repeater.

Octet	ASCII	Bin.Data	Hex Data
A15	W	10101110	AE
A16	B	10000100	84
A17	4	01101000	68
A18	J	10010100	94

A20	I	10010010	92
A21	SSID	HRRSSID1	

Bit Order --> 76543210

Fig 4. Repeater Address Encoding

Where:

1. The top octet is the first octet sent, with bit 0 being sent first, bit 7 sent last of each octet.

2. As with the source and destination address sub-fields discussed above, bit 0 of each octet is the HDLC address extender bit, which is set to zero on all but the last address octet (A21) where it is set to one.

3. The "R" bits are reserved just like in the source and destination sub-fields.

4. The "H" bit is the has-been-repeated bit. It is set to zero on a non-repeated frame, and set to one by the repeater when the frame has been repeated.

It should be noted that some of the advantages of this addressing scheme are mentioned in Appendix C.

Control_Field_Formats

The control field is responsible for identifying what type of frame is being sent, and is also used to convey commands and responses from one end of the link to the other to maintain proper control over the link.

The control fields used in AX.25 use the CCITT X.25 control fields for balanced operation, with an additional control field taken from ADCCP to allow connectionless and round-table operation.

There are three general types of AX.25 frames. They are the Information frame (I frame), the Supervisory frame (S frame), and the Unnumbered frame (U frame). Fig. 5 shows the basic format of the control field associated with these types of frames.

Control Field Type	Control Field Bits				
	7 6 5	4	3 2	1	0
I Frame	N(R)	P/F	N(S)		0
S Frame	N(R)	P/F	S S	0	1
U Frame	M M M	P/F	M M	1	1

Fig. 5. Control Field Formats

Where:

1. Bit 0 is the first bit sent, bit 7 is the last bit sent of the control field.

2. N(S) is the send sequence number (bit 2

is the LSB).

3. N(R) is the receive sequence number (bit 6 is the LSB).

4. The "S" bits are the supervisory function bits, and their encoding is discussed below.

5. The "M" bits are the unnumbered frame modifier bits and their encoding is discussed below.

6. The P/F bit is the Poll/Final bit. Its function is described in more detail shortly.

Control_Field_Definitions

Information Frame Control Field

All I frames have bit 0 of the control field set to zero. N(S) is the sender's send sequence number (the send sequence number of this frame). N(R) is the sender's receive sequence number (the sequence number of the next expected received frame. These numbers are described in the section regarding flow control.

Supervisory Frame Control Field

Supervisory frames are denoted by having bit 0 of the control field set to one, and bit 1 of the control field set to zero. S frames provide supervisory link control such as acknowledging or requesting retransmission of I frames, and link level window control. Since S frames don't have an information field, the sender's send variable and the receiver's receive variable are not incremented for S frames.

Unnumbered Frame Control Field

Unnumbered frames are distinguished by having both bits 0 and 1 set to one. U frames are responsible for maintaining control over the link beyond what is accomplished with S frames. They are also responsible for the establishment and tearing down of the link. U frames also allow for the transmission and reception of information outside of the normal flow control. Some U frames may contain information fields.

Control_Field_Parameters

Sequence_Numbers_and_Variables

Every AX.25 I frame shall be assigned a sequential number from 0 to 7. This will allow up to seven outstanding I frames per level 2 connection at a time.

Send_State_Variable_V(S)

The send state variable is an internal variable that is never sent. It contains the next sequential number to be assigned to the next transmitted I frame. This variable is updated upon the transmission of each I frame.

Send_Sequence_Number_N(S)

The send sequence number is found in the control field of all I frames. It contains the sequence number of the I frame being sent. Just prior to the transmission of the I frame, N(S) is updated to equal the send state state variable.

Receive_State_Variable_V(R)

The receive state variable is an internal variable that contains the sequence number of the next expected received I frame. This variable is updated upon the reception of an error-free I frame whose send sequence number equals the present received state variable value.

Received_Sequence_Number_N(R)

The received sequence number is in both I and S frames. Prior to sending an I or S frame, this variable is updated to equal that of the received state variable, thus implictly acknowledging the proper reception of all I frames up to and including N(R)-1.

Poll/Final_(P/F)_Bit

The P/F bit may be used in all types of frames. It is used in a command (poll) mode to request an immediate reply to a frame. The reply to this poll is indicated by setting the response (final) bit in the appropriate frame. Only one outstanding poll condition per direction is allowed at a time.

Control_Field_Encoding

Information_Frame_Control_Field

The information frame control field is encoded as shown in Fig. 6. These frames are sequentially numbered to maintain control of their passage over the link level connection.

Control Field Bits

7 6 5	4	3 2 1	0
N(R)	P/F	N(S)	0

Fig. 6. I Frame Control Field

Supervisory_Frame_Control_Field

The supervisory frame control fields are encoded as shown in Fig. 7. In AX.25, S frames are used only as responses to other frames.

Control Field Bits	7 6 5	4	3 2	1 0
Receive Ready RR	N(R)	P/F	0 0	0 1
Receive Not Ready RNR	N(R)	P/F	0 1	0 1
Reject REJ	N(R)	P/F	1 0	0 1

Fig. 7. S frame control Fields

Receive_Ready_(RR)_Response

Receive Ready is used to do the following:

1. To indicate that the sender of the RR is now able to recieve more I frames.

2. To acknowledge properly received I frames up to, and including N(R)-1.

3. To clear a previously set busy condition created by an RNR command having been sent.

It should be noted that the status of the other side of the link can be requested by setting the poll bit.

Receive_Not_Ready_(RNR)_Response

Receive not ready is used to indicate to the sender of I frames that receiver is temporarily busy and cannot accept any more I frames. Frames up to N(R)-1 are acknowledged. Any I frames numbered N(R) and higher that might have been caught in between and not acknowledged when the RNR command was sent are NOT acknowledged.

The RNR condition can be cleared by the sending of a UA, RR, REJ, or SABM frame. The P/F bit can be used within the RNR frame to interrogate the status of the other side of the link.

Reject_(REJ)_Response

The reject frame is used to request retransmission of I frames starting with N(R). Any frames that were sent with a sequence number of N(R)-1 or less are acknowledged. Additional I frames may be appended to the retransmission of the N(R) frame if there are any.

Only one reject frame condition is allowed in each direction at a time. The reject condition is cleared by the proper reception of I frames up to the I frame that caused the reject condition to be initiated.

As with the other supervisory responses, the P/F bit may be used in the REJ frame.

Unnumbered_Type_Frames

Unnumbered frame control fields are either commands or responses. This standard follows X.25 as much as possible. The only deviation from X.25 is in the addition of the Unnumbered Information (UI) frame from ADCCP. X.25 is designed to work with in full-duplex systems with only one main device (DCE) and potentially many users (DTEs).

Amateur Radio packet systems differ greatly on both of these respects. Not only is Amateur Radio packet networking done in a half-duplex rf environment, but many DCE/DTE links many be sharing the same channel. Many amateurs have rejected the use of X.25 as a result of these problems. X.25 can easily be enhanced so that it will perform properly over amateur radio.

Fig. 8 shows the layout of U frames implemented within this standard.

Set_Asynchronous_Balanced_Mode_(SABM)_Command

The SABM command is used to place 2 stations in the asynchronous balanced mode. This is a balanced mode of operation known as LAP B where DCEs and DTEs are treated as equals.

Information fields aren't allowed in SABM commands. Any outstanding I frames left when the SABM command is issued will remain unacknowledged.

Disconnect_(DISC)_Command

The DISC command is used to terminate a link session between two stations. No information field is permitted in a DISC command frame. Any outstanding I frames will remain outstanding.

Disconnected_Mode_(DM)_Response

The disconnected mode response is sent whenever the DTE or DCE receives a frame other than a SABM while in a disconnected mode. It is sent to request a set mode command, or to indicate it cannot accept a connection at the moment. The DM response cannot have an information field.

A DCE or DTE in the disconnected mode

will respond to any command other than a SABM with a DM response with the P/F bit set to 1.

Unnumbered_Acknowledge_(UA)_Response

The UA response frame is sent to acknowledge the reception and acceptance of a U frame command. A received command is not actually processed until the UA response frame is sent. An information field is not permitted in a UA frame.

Frame_Reject_(FRMR)_Response

The FRMR response frame is sent to report that for some reason the receiver of a command or information frame cannot successfully process that frame and that the error condition is not correctable by sending the offending frame again. Typically this condition will appear when a frame without an FCS error has been received with one of the following conditions:

1. The reception of an invalid or not implemented command or response frame.

2. The reception of an I frame whose information field exceeds the agreed upon length.

3. The reception of an improper N(R). This usually happens when the N(R) frame has already been sent and acknowldeged, or when N(R) is out of sequence with what was expected.

4. The reception of a frame with an information field where one is not allowed, or the reception of an U or S frame whose length is incorrect.

When a CMDR or FRMR frame is sent, an information field is added to the frame that helps to explain where the problem occurred. This information field is three octets long and its contents is shown if Fig. 9 below.

```

Fig. 9. FRMR Frame Information Field

Where:

1. The rejected frame control field carries the control field of the frame that caused the reject condition. It is in bits 1-8 of the information field.

2. V(S) is the current send state variable of the device reporting the rejection (bit 10 is the low bit).

3. V(R) is the current receive state variable of the device reporting rejection (bit 14 is the low bit).

4. If W is set to 1, the control field received was invalid or not implemented.

5. If X is set to 1, the frame that caused the reject condition was considered invalid because it was a U or S frame that had an information field that is not allowed. Bit W must be set to 1 in addition to the X bit.

6. If Y is set to 1, the information field of a received frame exceeded the maximum capacity of the device reporting the condition.

7. If Z is set to 1, the control field received and returned in bits 1 to 8 contained an invalid N(R).

8. Bits 8, and 20 to 23 are set to 0. Bit 12 is set to 0 if the rejected frame was a command, or 1 if if it was a response.

Unnumbered_Information_(UI)_Frame

The unnumbered information frame is used to pass information along the link outside the normal information controls. This allows information fields to go back and forth on the link bypassing flow control. Since these frames are NOT acknowledgeable, if one gets wiped out, there is no way to recover it.

The UI frame is not defined in X.25. It has been taken from ADCCP to allow uncontrolled information to flow thru the link without interfering with a next higher layer.

Link_Error_Recovery

There are several link-level errors that are recoverable without tearing down the connection. These error situations may occur as a result of malfunctions within the DTE or DCE, or if transmission errors occur.

Invalid_Frame_or_FCS_Error

If an invalid frame is received, or a frame is received with an FCS error, that frame will be discarded with no action taken.

Device_Busy_Condition

When a DTE or DCE becomes temporarily busy, such as when receive buffers are full, it will send a receive not ready (RNR) frame. This tells the other side of the link that the device cannot handle any more I frames at the moment. This condition is usually cleared by the sending of a UA, RR, REJ, or SABM command frame.

Send_Sequence_Number_Error

If the send sequence number , N(S), of an otherwise error-free received I frame does not match the receive state variable, V(R), a send sequence error has occured, and the information field will be discarded. The receiver will not acknowledge this frame, or any other I frames until N(S) matches V(R).

The control field of the erroneous I frame(s) will be accepted so that link supervisory functions can still be performed, such as checking the P/F bit. Because of this updating, the retransmitted I frame may have an updated P bit and N(R).

Reject_(REJ)_Error_Recovery

REJ is used to request a retransmission of I frames following the detection of a sequence error. Only one outstanding reject condition is allowed at a time. This condition is cleared when the requested I frame has been received.

A device receiving the REJ command will

clear the error by sending over the I frame indicated in N(R) of of the REJ command frame.

Time-out_Error_Recovery

When a transmission abnormality wipes out a single I frame, or the last I frame of a group, there is no way of telling this immediately, since the receiver does not necessarily know something was sent until another frame is sent resulting in an out-of-sequence error. To cope with this situation better, some form of time-out delay will be incorporated by the sender after it sends out a frame. This time-out timer is started at the time a frame is sent, and stopped by the reception of an acknowledgement for the sent frame. If the timer times out before an acknowledgement is received, any unacknowledged frames are retransmitted. The delay is an agreed-upon amount that will vary with the type of rf medium and signaling speed used.

Rejection_Error

A rejection error condition occurs when an error-free received frame has one of the following problems:

1. An invalid command or response control field.

2. An invalid frame format.

3. An Invalid N(R).

4. An information field that exceeds the maximum the device can accept.

Once a rejection error occurs, no more I frames are accepted (with the exception of the P/F bit still usable) until the error is resolved. The error condition is reported to the other side of the link by sending a FRMR response frame.

Primary/Secondary_versus_Balanced_Operation

There are two basic classes of link-level connections. The first, known as Link Access Procedure (or LAP) is often called an unbalanced service where the DCE is considered the primary (or master) devices and the DTEs are considered secondary (or slave) devices. The second class of service is known as LAPB, Link Access Procedure Balanced. In this service both devices are treated as equals as far as connection requests and other types of commands. There is still only one DCE and potentially many DTEs, but both ends can command the link equally.

Primary/Secondary_(LAP)_Operation

LAP is the older style of link control, where most of the intelligence was assumed to be in a large mainframe (the DCE) and the end users were just using smart terminals (the DTEs). Since network software can have a lot of overhead, it made sense at the time to put most of the overhead in the big computer, and just enough smarts to make the link work in the terminals.

Balanced_(LAPB)_Operation

LAPB is a slightly modified version of LAP. It has been changed to allow the two sides of a link to operate in a more balanced manner. In the official version of X.25 there is still only one DCE to potentially many DTEs, but the two can operate more as equals than master and slave.

LAPB is what this document describes for use over Amateur Radio packet networks. Even when there is a network controller overseeing the network operation, the balanced link procedure will enhance operation.

Connection_Operation

In amateur radio network operations, it would be very helpful if one level 2 protocol would work with the various rf systems in use. An example of this is the difference in operation between a simple two-station link, and multiple stations operating thru a network controller. Obviously, when a network controller exists, it should be considered the DCE, while the other stations connecting to it would be the DTEs. A simple two-station connection is another matter. To this type of connection the station requesting a connection should always be considered the DTE, while the device that is receiving the connection request should operate as the DCE. This simple rule should eliminate any ambiguity that might otherwise occur under these conditions.

NOTE There are a couple minor changes from the official X.25 standard in the protocol recommended here. These changes are done only as absolutely necessary to work over the shared rf media. Since X.25 was written to work so that one DCE talked with many DTEs over a closed network, it cannot properly cope with a channel where there may be many DCEs linked to many DTEs. Some amateurs have thrown X.25 out because of this problem. It seems to take just a couple minor changes in the initial link set-up procedure to make X.25 work properly over amateur radio. Where these changes are made, both the original X.25 procedure and the recommended amateur procedure will be noted.

LAPB_Procedures

The following describes the procedures used to set-up, use, and disconnect a balanced link between a DTE and DCE. These procedures have been taken from X.25 and conform very closely to that standard, except where it was necessary to change due to the radio enviroment.

Address_Field_Operation

All transmitted frames shall have address fields conforming to above-mentioned rules. All frames should have both the destination device and the source device addresses in the address field, with the destination address coming first. This will allow many links to share the same rf channel. The destination address is always the address of the station(s) to receive the frame, while the source address contains the address of the dveice that sent the frame. The destination address can be a group name or club call however, if point to multi-point operation is allowed. This will be discussed further under link operations.

LAPB_Connection_Establishment

When a device (either a DCE or DTE) wishes to connect to another device, it will send a SABM command frame to that device and start a time-out timer (T1). If the other device is there and able to connect, it will answer with a UA response frame and at the same time reset both of it's internal state variables (V(S) and V(R)). The reception of the UA response frame at the other end will cause the device requesting the connection to abort the T1 timer and set its internal state variables to 0 also.

If the other device doesn't respond before T1 times out, the device requesting the connection will re-send the SABM frame, and start T1 running again. This trying to establish a connection will continue until the requesting device has tried unsuccessfully a number of times. That number (N1) is variable, depending on the frequency of operation, type of transmission (eg. terrestial vs. satellite), and the signaling speed in use. N1 will be discussed in another section.

Information_Transfer

Once a connection has been established as outlined above, both devices are able to accept I, S, and U frames.

Sending_of_I_Frames

Whenever a station has an I frame to transmit, it will send the I frame with N(S) of the control field equal to it's current send state variable V(S). Once the I frame is sent, the send state variable is incremented by one.

The station should not transmit any more I frames if it's send state variable equals the last received N(R) from the other side of the link plus seven. If it were to send more I frames, the flow control window would be exceeded and errors could result.

If a device is in a busy condition, it may still send I frames as long as the other device is not also busy.

If a device is in the frame-rejection mode, it will stop sending I frames.

Receiving_I_Frames

If a device receives a valid I frame (one with a correct FCS and whose send sequence number equals the receiver's receive state variable) and is not in the busy condition, it will accept the received I frame, increment it's receive state variable, and act in one of the following manner:

1. If it has an I frame to send, that I frame may be sent with the transmitted

N(R) equal to it's receive state variable V(R) (thus acknowledging the received frame. Alternately, the device may send an RR frame with N(R) equal to V(R), and then send the I frame.

2. If there are no outstanding I frames, the receiving device will send an RR frame with N(R) equal to V(R).

If the device is in a busy condition, it may ignore any received I frames without reporting this condition other than repeating the indication of the busy condition.

If a busy condition exists, the station receiving the busy condition indication should poll the sender of the busy indication periodically until the busy condition disappears.

The reception of I frames that contain zero length information fields shall be reported to the next level but no information field will be transferred.

When an I frame is received with a correct FCS, but it's send sequence number does not match the current receiver's receive state variable, the frame should be discarded and a REJ frame should be sent with a receive sequence number equal to one higher (modulo 8) than the last correctly received I frame . Any out-of-sequence received I frames should be handled in this manner. The received state variable and poll bit in such a discarded frame should be checked before throwing it away, and take any action needed depending on the condition of them.

Receiving_Acknowledgement

Whenever an I or S frame is correctly received, even in a busy condition, the N(R) of the received frame should be checked to see if it includes an acknowldegment of outstanding sent I frames. The T1 timer should be reset if the received frame actually acknowledges previously unacknowledged frames. If the T1 timer is reset, and there are still some frames that have been sent that are not acknowledged, T1 should be started again. If the T1 timer runs out before an acknowledgement is received, the device should proceed to the retransmission procedure.

Receiving_Reject

Upon receiving a REJ frame, the transmitting station will set its send state variable to the same value are the REJ frames received sequence number in the control field. The device will then retransmit any I frame(s) outstanding at the next available opportunity conforming to the following:

1. If the device is not transmitting at the time, and the channel is open, the device may commence to retransmit the I frame(s) immediately.

2. If the device is operating on a full duplex channel transmittiong a U or S frame when it receives a REJ frame, it may finish sending the U or S frame and then retransmit the I frame(s).

3. If the device is operating in a full duplex channel transmitting another I frame when it receives a REJ frame, it may abort the I frame it was sending and start retransmission of the requested I frames immediately.

4. The device may send just the one I frame outstanding, or it may send more than one if any more I frames followed the first one not acknowledged, provided the total to be sent does not exceed the flow control window (7 frames).

If the device recives a REJ frame with the poll bit set, it should respond with either an RR or RNR frame with the final bit set before retransmitting the outstanding I frame(s).

Receiving_an_RNR_Frame

Whenever a device receives an RNR frame, it may transmit or retransmit the I frame whose send sequence number equals that of the received sequence number indicated in the RNR control field. If timer T1 runs out after the RNR was received, the waiting acknowledgement procedure listed below should be performed. The poll bit may be used in conjunction with S frames to test for a change in the condition of the busied out station. No I frames other than the one mentioned above may be sent out before the busy condition is cleared.

Sending_a_Busy_Indication

Whenever a device enters a busy condition, it will indicate this by sending an RNR response at the next opportunity. While the device is in the busy condition, it may receive and process S frames, and if a received S frame has the P bit set to one, the device should send a RNR frame with the F bit set to one at the next possible opportunity. To clear the busy condition, the device should send either a RR or REJ frame with the received sequence number equal to the current receive state variable, depending on whether the last received I frame was properly received or not.

Waiting_Acknowledgement

The device should maintain an internal retransmission count variable which is set to zero whenever another I frame is acknowledged (either thru the reception of a UA or RNR frame, or when a received I or S frame has an N(R) higher than the last received N(R), showing the acknowledgement of additional I frames).

Any time the timer T1 runs out, the device will re-enter the timer recovery condition, the retransmission count variable will be incremented by one, and another internal variable (X) will be set to the current send state variable value.

The device will then restart the T1 timer, set its receive state variable to the last receive sequence number, and retransmit the corresponding I or S frame with the P bit set to one.

The timer recovery condition is cleared when the device receives a valid S frame with the F bit set to one.

If the device receives an S frame with the F bit set to one and N(R) within the range from the current send state variable to X mentioned above inclusive while in the timer recovery condition, this condition will be cleared, and the send state variable will be set to the N(R) received.

If the device receives an S frame with the F bit set to zero but otherwise the same condition as the last paragraph, the timer recovery condition will NOT be cleared. The received N(R) may be used however to update the send state variable. The device may keep the last I frame transmitted (even if it was acknowledged) to be retransmitted with the P bit set to one if timer T1 expires at a later time.

Once the retransmission count variable reaches N2, the device should proceed to the resetting procedures outlined below.

Link_Disconnection

When in the information-transfer phase, either device may initiate a link disconnection by sending a DISC frame. It should then start its T1 timer, and wait for a response. If the proper response doesn't come before T1 times out, it should send the DISC frame again and restart T1. If this happens N2 times, the device should enter the disconnected state.

When a DISC frame is received, the receiver should return a UA response frame, and enter the disconnected state.

Disconnected_State

After having sent a DISC frame and received a UA, or receiving a DISC and having sent a UA, the device will enter the disconnected state.

In the disconnected state, the device may initiate a link set-up as outlined in connection establishment above. It may also respond to the reception of a SABM and establish a connection, or it may ignore the SABM and send a DM instead.

Any station receiving a DISC command while in the disconnected state should send back a DM response frame.

Any device receiving a command frame other than a SABM or UI frame with the P bit set to one should respond with a DM frame with the F bit set to one. The offending frame should also be ignored.

When the device enters the disconnected state after an error condition or if it has recovered from an internal error condition by coming up in the disconnected state, it should indicate this by sending a DM response rather than a DISC frame. It should start the T1 timer when the DM is sent, and if T1 times out before getting a SABM or DISC frame back, it should send another DM frame, and restart T1. After retransmitting the DM frame N2 times, the device will remain in the disconnected state, and no other action will be taken.

Resetting_Procedure

The resetting procedure is used to initialize both directions of flow after a non-recoverable error has occured. This resetting procedure is only used when in the information transfer phase of an AX.25 link.

A device shall request a reset by sending an SABM frame. Upon receiving an SABM frame from a station previously connected to, the receiver of an SABM frame should send a UA frame back at the earliest opportunity. Both devices should then set their send and receive state variables to zero. Any busy condition that previously existed will also be cleared.

It is possible to initiate a disconnect procedure instead of resetting the link.

One device may ask the other to reset the link by sending a DM response frame. After the DM frame is sent, the sending device will then enter the disconnected state.

One device may ask the other to initiate a link reset by transmitting a FRMR response frame.

After sending the FRMR frame, The sending device will enter the frame reject state. This condition is cleared when the device that sent the FRMR frame receives an SABM or DISC command, or a DM response frame. Any other command received while the device is in the frame reject state will cause another FRMR to be sent out with the same information field as originally sent.

The device that sent the FRMR frame should start the T1 timer when the FRMR is sent. If above mentioned frames are not received before the timer runs out, the FRMR frame should be retransmitted, and the T1 timer restarted as described in the waiting acknowledgement section above. If the FRMR is sent N2 times without success, the link should be reset.

Rejection_Conditions

A device should initiate the link-reset procedure when a frame is received with the correct FCS and address field during the information transfer phase with one or more of the following conditions:

1. The frame is not known as a command or response to the device.

2. The information field is invalid (as an example is longer than 256 octets).

A device will initiate a reset procedure whenever it receives a DM or FRMR response frame during the information transfer phase.

A device may initiate a reset procedure also whenever it receives a UA response frame or if it receives an unsolicited response frame with the F bit set to one.

Collision_Recovery

Collisions_in_a_Half-Duplex_Enviroment

Collisions of frames of any type in a half-duplex enviroment are essentially taken care of by the retry nature of the T1 timer and retransmission count variable. No other special action needs to be taken.

Collisions_in_a_Full-Duplex_Enviroment

Collisions in a full-duplex enviroment are not really frame collisions, but have more to do with the devices being pulled in two different directions at the same time.

Collisions_of_Unnumbered_Commands

If the sent and received U command frames are the same, both devices should send a UA response at the earliest opportunity, and both devices should enter the indicates state.

If the sent and received U commands are different, both devices should enter the disconnected state, and transmit a DM frame at the earliest opportunity.

Collision_of_a_DM_with_a_SABM_or_DISC

When an unsolicited DM response frame is sent, a collision between it and a SABM or DISC may occur. In order to prevent this DM from being misinterpreted, all unsolicited DM frames should be transmitted with the F bit set to zero. All SABM and DISC frames should be sent with the P bit set to one, so there isn't any confusion when a DM frame is received.

Connectionless_Operation

In Amateur Radio circles, there is a type of operation that isn't really feasable using level 2 connections. This operation is the roundtable, where several amateurs may be engaged in one conversation. The only way to accomplish this in a connected mode would be to have everyone cross-connected with each other. This would require a seperate frame to be sent to each member of the roundtable every time someone says something. Obviously, this mode is not practical. The way most amateur packet radio enthusiasts have ended up implementing the roundtable operation is outside the AX.25 connection, but still using the AX.25 frame structure. AX.25 does allow a special frame for this operation, called the Unnumbered Information (UI) frame. It is recommended that when this type of operation is in use, the destination address have a code word installed in it to prevent the users of that particular roundtable from seeing all frames going thru the shared RF medium. An example of this is if a group of amateurs are in a roundtable discussion about packet radio, they could put PACKET in the destination address, so they would only receive frames from others in the same discussion. An added advantage of the use of AX.25 in this manner is that the source of each frame is in the source address sub-field, so software could be written to automatically display who is making what comments.

Admittedly, this is a kludge to the level 2 AX.25 protocol. THis type of operation really belongs at the next layer (layer 3, packet level) of operation, but until layer 3 is implemented, this appears to be an acceptable substitute.

Keep in mind that this mode is connectionless, so all transmitted frames should be of good quality, as there will be no requests for retransmissions of bad frames. Collisions will also occur, with the potential of losing the frames that collided.

List_of_System_Defined_Parameters

Timers

It is recommended that there are two timers used to maintain the integrity of the AX.25 layer 2 connection.

The first timer, T1, is used to make sure a device doesn't wait forever for a response to a frame it sends. This timer cannot be expressed in absolute time, since the time required to send frames varies greatly with the baud rate used at level 1. T1 should be at least twice the time it would take to send a maximum length frame to the other end of the link, and get the proper response frame back from the other end of the link. This would allow time for the other end of the link to do some processing before responding.

The second timer, T2, is used whenever T1 isn't running to make sure that a supervisory frame is sent periodically to maintain link integrity. It also will vary dramatically depending on layer 1 constraints, and is subject for further study.

Maximum_Number_of_Retrys_(N2)

The maximum number of retrys is used in conjunction with the T1 timer. It will vary depending on the layer 1 in use, but will generally be sixteen.

Maximum_Number_of_Octets_in_an_I_Field_(N1)

The maximum number of octets allowed in the I field will be 256. There should also be an even multiple number of octets.

Maximum_Number_of_I_Frames_Outstanding_(k)

The maximum number of outstanding I frames at a time is seven. A smaller number may be used at any time, provided it is agreed upon ahead of time.

The frame shown is an SABM frame, not going thru a level 2 repeater, from WB4JFI (SSID=0) to K8MMO (SSID=0), with no level 3 protocol.

The above frame is the same as in Appendix A, but with the addition of a repeater address sub-field (WB4JFI, SSID=1). The H bit is set, indicating this is from the output of the repeater.

Appendix C.
Advantages of the WB4JFI Addressing Scheme

Some of the advantages to using this addressing system are:

1. Every packet station will have a unique fixed address that doesn't change every time a new network is logged into.
2. Relocating to a new area won't cause major (or minor) problems.
3. Allows for more than 62 or 31 users at a time.
4. No local packet guru is needed to assign addresses with attendant concerns of backup and transfer during failure.
5. Direct or network operation requires no change of address.
6. All the problems with dynamic allocation/de-allocation are eliminated.

7. Reduces local co-network interference due to users in overlapping local network rf domains with the same address fields.

8. With every frame having both the destination and source addresses in them, it will be a lot easier to set-up and run multiple connections on the same data channel without having problems arise as to who is sending what frames to whom.

9. In round-table operation, every frame sent will have the source address imbedded in it, allowing automatic printing of the source of the frame.

HamRadioNow: 10-10 International; Digital for Alabama ARES

HAMRADIONOW EPISODES 71 and 72: Online Now

71: Ten-Ten International Net

10 meters is supposed to be hopping these days, but instead, it's limping. And when the sunspot cycle is near minimum, 10 stays dead for months on end. 10-10 International was formed to encourage 10 meter use all the time, initially to stave off a potential CB expansion back in the 60's. Now it's just to have fun on this quirky band. Jeff and Gary talk to Gerry Gross WA6POV, former 10-10 president, at the Orlando HamCation, to see what the group is all about.

72: Digital Modes for Alabama ARES

Alabama hams were early D-STAR adopters, led by the ARRL Section and ARES officials. And it's not just D-STAR. ARES hams are encouraged to experiment and adopt a variety of digital modes, and they're in use routinely. Gary talks to Section Manager Dave Drummond W4MD, and Assistant Section Manager Tommy Howell KG4MPU about how it's working.

And when the sunspot cycle is near minimum, 10 stays dead for months on end. 10-10 International was formed to encourage 10 meter use all the time, initially to stave off a potential CB expansion back in the 60's. Now it's just to have fun on this quirky band. Jeff and Gary talk to Gerry Gross WA6POV, former 10-10 president, at the Orlando HamCation, to see what the group is all about.

> Tommy Howell KG4MPU about how it's working.

I can't speak for the Ten Ten International group as a whole, but I wish
they would eat crap and die.
Those people are WORSE then the CB radio when it comes to good operating
practices.

Every time they have one of their crappy contests - they explode upon
the band and just set up everywhere and anywhere and they do not follow
the band plan.. I can mention two retards from Georgia as a example.
A husband and wife team that sets up on 28.400 and 28.415 - Chandra is
the one I remembered talking to.

When you try to explain the band plan to them, they give every excuse
from soup to nuts why they are operating on the CALL FREQUENCIES!

It only stands to reason that the very people they were trying to
protect 1o meters from is the same that they turned into.

The collection of dues / have to pay to join 10 10 to participate, and
the 10 10 numbers only helps to exacerbate the problem - not solve it.

I just give them my zip code - that messes with their heads!

April 15 is fast-approaching, so there is not much time left to get your contribution in for the next issue of TAPR's quarterly newsletter, PSR.

The Spring 2011 - Pre-Hamvention issue of TAPR PSR is in the works. If you would like to contribute to that issue, please send me your stuff ASAP.

(Every contribution to TAPR PSR extends your TAPR membership by three months.)

I'm looking forward to your input!

73,

WA1LOU - TAPR PSR Editor

TAPR Hamvention Location

TAPR will be up and at 'em throughout the Hamvention at booths 455-458 in the Ball Arena of the Hara Arena --- same place as last year in the same neighborhood as ARRL and AMSAT

TAPR Digital Forum

Friday May 20, 2011, HARA Arena, Room 1

09:15 AM � Welcome and TAPR Update by Steven Bible, N7HPR

09:30 AM � HPSDR Update by Scotty Cowling WA2DFI

An update on the High Performance Software Defined Radio (HPSDR) project (www.openhpsdr.org). Existing and future projects as well as board availability.

10:00 AM � Griffin: a Whisper and a Chirp by Phil Harman, VK6APH

Griffin is a new HPSDR project that will provide a low power beacon exciter.Covering HF, 6m and 2m, Griffin will generate simultaneous beacons on multiple bands, each modulated independently. Basing Griffin around a large FPGA provides modulation modes such as CW, RTTY, WSPR etc as well as future, as yet unknown modes. An on-board GPS receiver will provide highly accuracy frequency and time control of all beacons. An Ethernet connection will enable remote control and configuration via the Internet. In addition, a revolutionary new beacon mode will enable real time propagation measurement and reporting for all HF and VHF bands.

10:30 AM � CODEC 2 and Open Hardware by Bruce Perens, K6BP

(At the last minute, David Rowe, VK5DGR, had to cancel his trip to

Dayton for personal reasons, so Bruce Perens, K6BP, has stepped in to fill the slot.)

TAPR-AMSAT Hamvention Banquet

"Power from Space and in Your Shack"
By Bob Bruninga, WB4aPR

Last year Solar energy passed from a niche market for greenies to an economic opportunity that beats money in the bank. The monetary return for every dollar on your roof can exceed 10% per year for life which far exceeds the security of any other investment in a bank or our fickle economy. But this economic advantage is overlooked, misunderstood or wasted by many hams because of our warped and twisted prior love-affairs with batteries and generators on which we depend for field-day and emergency power.

To fully grasp today's economics of renewable energy we must learn to completely separate our needs for economical energy 99.9% of the time from our desires for emergency power for only 0.1% of the time. There are economical solutions for both but they are separate and mutually exclusive.

Further, over the last decades there has been a hidden evolution of power supplies in every aspect of our daily lives. Everything we do with energy from our ham shack to our big screen TV depends on this technology but it has also provided us with unbelievable versatility to access power from just about any source from 100 to 240 VAC or 100 to 330 VDC or any voltage down to 12 volts.. Where to find power? Have you looked on the roof of your house or under the hood of your car recently? The better that hams understand these subtle evolutionary changes in energy, the better we are prepared not only for Field Day, for emergencies but also for the future of our families.

Summertime - and the living is easy except at the Packet Status Register offices where the editors are sweating over the next issue of TAPR's quarterly newsletter. In addition to seeking relief from the humidity, the editors are also seeking articles for the next issue, pre-DCC issue, of PSR. So if you have anything to contribute, please send it before the August 15 deadline.

The August 15 deadline for the DCC issue of TAPR's quarterly newsletter,

Packet Status Register (PSR), is coming soon. If you have anything to

contribute to the next issue, please send it to me as soon as you can.

PSR is looking for a few good writers, particularly ham radio operators

working on the digital side of our hobby, who would like to publicize

their activities in the newsletter.

You don�t have to be Shakespeare to contribute to PSR and you don�t have

to use Microsoft Word to compose your thoughts. We can handle just about

any text and graphic format, so don�t be afraid to submit whatever you

have to wa1lou@tapr.org .

Stan, WA1LOU

Sunday Seminar

Universal Ham Radio Connectivity by Callsign Workshop - Bob Bruninga, WB4APR

With Today's proliferation of wireless electronic devices, we need a transparent means of providing end-to-end ham radio connectivity for both text and voice to any ham anywhere using any device and only his callsign for addressing. Our callsigns are unique in the world. We should be able to use them for placing a call or text using any system in real time. The goal of this workshop is to look at the handful of VOIP and more than 26 different text messaging systems in Ham radio and see where we can provide transparent connectivity. We invite experts on all systems to participate and share ideas towards this goal.

Demonstration Room

Be sure to bring your projects to show in the demo room. Even if you are not speaking. Each year at the DCC a separate (and lockable) room is provided for people to bring and show off their latest projects. Tables and power will be provided. Bring your equipment and display for all to see, learn, and ask questions about. Be sure to bring a small sign and/or flyer naming and describing your project.

Saturday Night Banquet Speaker

The Village TELCO - David Rowe, VK5DGR

There are now billions of mobile phones all over the world. However in many developing countries, mobile phones are simply too expensive to use. For example, in a country where people earn $1.50/day, a phone call can cost 21 cents/minute. This is a huge tax on communications.

David Rowe, VK5DGR, will describe how a community of people from around the world set out to fix this problem, using a mix of Wi-Fi and open source software. The result is the Village Telco - a DIY telephone company that anyone can set up.

A Village Telco is constructed from a network of "Mesh Potatoes" - small Wi-Fi boxes that are mounted on homes in a village. They form a mesh network, relaying telephone calls for each other. Each Mesh Potato connects to a regular telephone inside village homes. Phone calls on the network are free. A local person in the Village can be trained in a few hours to set up and maintain the network.

To build the Village Telco we borrowed many ideas from Ham Radio, such as sharing hardware designs and community networks.

The talk will include real world stories of how Village Telcos are helping people in several developing countries, and explain why a simple phone call that we take for granted can be so important.

Did you attend the DCC?

If so, consider composing your thoughts about the event and submitting them to TAPR as an article or commentary for the next issue of our quarterly newsletter, PSR.

If you have photos from the DCC and would like to share them via PSR, please send them along, too.

In addition to words about the DCC, the TAPR editorial staff is looking for articles (long or short) about what you are doing in Amateur Radio today that other members of TAPR would find interesting.

You don't have to be Hiram Percy Maxim to contribute to PSR and you don't have to use Microsoft Word to compose your thoughts. We can handle just about any text and graphic format, so send us what you got!.

The deadline for the fall issue of PSR is October 15.

September 2011 Nebraska Section News

Greetings and welcome to Fall!

We are finally making real progress on the Nebraska D-Star Emergency Network. Many of you have heard me talk about this. The idea is to provide a D-Star statewide network to facilitate communications between and among Nebraska’s amateur radio emergency communications groups and through them, between county emergency operations centers and the Nebraska Emergency Management Agency. Ten cities are named in the initial phase. The D-Star repeater in Lincoln has been operating now for a few years. This is one of three repeaters purchased by the State through a fortuitous funding opportunity. Since Omaha has a private group supplying a repeater for the system, the additional two units are slated for Grand Island and Kearney. The Grand Island repeater is now up and running. The Omaha repeater is operating at a temporary location. It appears that all the obstacles have been removed to install this repeater on the tallest building in Omaha. We thought we had a site for the Kearney machine, but the deal “fell through” and we are working on a new location. In addition, several counties have purchased D-Star repeaters on their own. These will eventually become part of the state-wide system, at the discretion of the county’s emergency management.

Bob Eastwood, W0RJE, is the leader of the D-Star effort. Our technical guru is Myron Coleman, NG0M. In order to get call signs for the machines and to form an organization to support the system, we formed the Nebraska D-Star Club. Bob is president, Myron is VP, I am secretary, and Jon Morris, KA0JGG, is the treasurer. The club held its first full meeting on Saturday, September 24. The club’s constitution and bylaws were approved. Nebraska residents who own D-Star radio equipment are invited to be full members of the club. Any amateur, without a D-Star radio, who is interested in D-Star and emergency communications, can be an Associate Member. We formed a Governance Committee consisting of the officers, repeater owners/operators, repeater trustees, and emergency managers for the counties using the statewide system. This committee will set operating policies and help plan the future of the system. Naturally, the Governance Committee will expand as new repeaters are brought online. Trustees, by the way, are volunteers located in the communities housing (or close to) the repeaters.

The repeaters and system are open for use by any licensed amateur radio operator. You do not need to be a member of the club. We are experimenting with a reflector-based linking system called “Nebraska Permalink” which allows automatic linking among the repeaters in the system. So if you make a call in Omaha, your voice will appear in receivers in Lincoln and Grand Island (and any additional repeaters as they become available). Full D-Star functionality is also available which will allow you to talk to D-Star users around the world.

During emergency conditions, however, the system will be restricted to emergency traffic. We are working on a signal or voice loop, etc., to announce that condition. Normal day-to-day amateur communications are encouraged when there is no emergency situation. There is no better way to be sure an emergency resource is working than to use it.

Right now, the systems are linked via the Internet. When it becomes operational, we will move the linking to a new State-owned microwave network. Eventually, we would like to have the D-Star system linked via amateur radio microwave so that we are completely independent of other communications systems. We would, of course, be able to fall back to the state microwave or the Internet.

For more information on the Nebraska D-Star system, please visit: http://www.nedstar.org. This website shows the system status. Eventually users will even be able to configure some of the network functions via this site.

Roger Grant, KB0VVD, wrote and asked if storm spotting will still be done on 2-meter FM or if everyone will need to switch to D-Star.

I tried to make it clear in my newsletter and I apologize if I didn't make it clear enough. The Statewide D-Star system is in addition to all that we now do. It offers an additional capability and is not intended to replace our current 2-meter FM activities. The Statewide system gives us the abililty to keep county emergency managers in touch with each other and with the state emergency operations center. It also allows us to coordinate ham radio resources if that becomes necessary. In fact, we will be experimenting with linking FM repeaters into the system.

Some day in the future, digital communcations may replace FM just like SSB replaced AM a few decades ago. But until that time, your VHF and/or UHF radios will continue to be the workhorses in our emergency communications arsenal.

Sorry if I caused any concern.

If you chose to get into D-Star, you are, of course, most welcome to use the system.

PRESS RELEASE

18 March, 2012 (Richardson, TX) � TAPR (tapr.org) announces the opening

of the interest list for the openHPSDR (openhpsdr.org) Hermes

single-board SDR. The Hermes interest list is used by TAPR to determine

the number of Hermes boards to manufacture in the pending initial

production run this spring.

Hermes is a long-awaited addition to the openHPSDR project lineup,

advancing through four prototypes while evolving from a USBbased to an

Ethernet-based transceiver in about two years. Hermes is a

Direct-Down-Conversion receiver, a Direct-Up-Conversion 500mW

transmitter and a gigabit Ethernet interface all on one board. Also on

board is an RF-quiet switch-mode power supply, allowing Hermes to run

from a single 13.8V DC supply.

More information can be found on the Hermes Wiki:

http://openhpsdr.org/wiki/index.php?title�RMES

To show your interest, you can sign up here:

I wonder why not this as an idea...

regular broadcasts in digital mode of amateur dx net schedules?

someone oughta collect when their times are and make a regular
digital
broadcast... just incase you live in the boonies with no internet :)

wouldn't that make sense too for how to find where clear frequencies
are?
like, technically?

The deadline for the spring edition of TAPR's quarterly newsletter, PSR, is upon us. So get your stuff together and e-mail it to me as soon as you can.

By the way, the spring edition is the pre-Hamvention edition, so if you have anything Hamvention-related, now is the time to get it into the newsletter.

Thank you in advance!

TAPR is pleased to announce that Hermes, an HF transceiver incorporating the capabilities of the existing "Atlas Bus" HPSDR receiver, exciter, and computer interface onto a single board, is now available for order at http://tapr.org/kits_hermes.html

The Hermes board is completely assembled and tested, and is offered at the following prices.

TAPR member: $895
TAPR non-member: $940

The order page will close Wednesday July 25th, so don't delay!

Please note that TAPR will be building only one production run of Hermes boards, and will only build the number necessary to fulfill the orders received on or before before the July 25th cutoff date.

Estimated delivery is October 15, and earlier if possible. Be a part of history and support HPSDR!

I'm wondering if you are a ham radio listener or a ham radio operator?

If you have a transceiver and a computer, you can link the two and down
load a program and read what is being sent, and the program can identify
which mode is being used.

I'm not sure if a ham radio receiver has the same data port - so I
cannot comment without knowing more about your station...

TAPR remembers John Bennett, N4XI, who died Sunday morning, July 22 after a year-long bout with cancer.

A long-time member of TAPR, John created kits that interfaced with the TAPR T-238+ APRS Weather Station and his own Linux-based WXN weather server over APRS. His kits included the X1W-1 1-wire weather sensor, the X1W-2 outdoor humidity and temperature sensors, and the X1W-2 EMP sensor.

John was a regular at TAPR's Dayton Hamvention booth and on the TAPR WXSIG patiently handling all questions concerning his kits and weather stations, in general.

This past May, John dropped by the TAPR Hamvention booth briefly just to say "Hello" to his old friends at TAPR.

TAPR now says, "Goodbye, old friend."

Mark your calendar and start making plans to attend the premier technical conference of the year, the 31st Annual ARRL and TAPR Digital Communications Conference to be held in Atlanta, Georgia, on September 21-23, 2012, at the Sheraton Gateway Hotel Atlanta Airport.

We're thrilled to be bringing the DCC to Atlanta for the first time!

If you're one of the many hams interested in D-Star, APRS or other packet radio operation, Software Defined Radios, HF data or digital voice modes, digital TV, or any other activity combining computer and radio technology, you'll find something at the DCC for you.

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications.

And, you don't need to be an expert to attend -- in addition to papers on cutting-edge topics, there will also be a track of introductory sessions including D-Star, APRS, and HF digital modes.

The DCC runs all day on Friday, Sep. 21 and Saturday, Sep. 22, with an in-depth seminar on using open source Gnuradio software to turn your laptop into an SDR on Sunday morning, Sep. 23. There will be a social event Friday evening and a banquet dinner on Saturday.

More details, including a preliminary schedule of events and a link to the registration form, are at:

http://www.tapr.org/dcc

You may register for one, two, or all three days. Advance registration for attendance is not required, but is discounted from event-day prices. Tickets for meals must be purchased in advance.

If you have questions about the DCC, please contact John, N8UR, at jra@febo.com.

Here are TWO important HPSDR announcements from TAPR.

****

HPSDR Metis Gigabit Ethernet Interface Board Announcement!

TAPR announces the planned production of Metis Gigabit Ethernet Interface Boards for the High Performance Software Defined Radio (HPSDR) project. We invite you to show your interest on or before November 15th, 2010.

We are doing a single volume build, and it is uncertain when the next one will be, or if there will even be a next one. This is a very exciting project, and we don't want anyone to be left out.

We now have pricing information on the web page and request that you show your interest by visiting the interest page and entering the number of Metis boards that you want to purchase.

More information here: http://openhpsdr.org/wiki/index.php?title=METIS

Go to: HTTP://www.hamsdr.com

Login and go to Projects > TAPR-HPSDR and follow instructions provided on that page.

****

HPSDR Alex LPF/HPF Filter Boardset Announcement!

TAPR is approaching production on the Alex LPF and HPF filter boards. In order to get a more up to date indication of interest, the interest list numbers were cleared on October 18, 2010.

Please re-enter your current interest in Alex RX (HPF), Alex TX (LPF) and Alex Enclosure on the list.

More information here: http://openhpsdr.org/wiki/index.php?title=ALEXIARES

Go to: HTTP://www.hamsdr.com

Login and go to Projects > TAPR-HPSDR and follow instructions provided on that page.

I find it sad that amateur radio operators feel the need to loose respect for each other just because these newsgroups are *mainly* accessed from the internet.

Mention the "internet" aspect of these forums and suddenly people feel it's ok to bash, curse, and make all out war with each other.

I should remind all that these newsgroups are also fed in and out of packet radio BBS stations and read and replied to over RF in nearly all countries utilizing packet BBS's.

Your name calling, cursing and war-ing all go out over the air ways and do nothing to foster and promote the art of amateur radio.

The 'art' of amateur radio?

A bunch of fat, sweaty, socially-maladjusted losers, sitting by themselves in their shacks for hours on end, grousing about how this newfangled interwebnet will never be as useful as the radio they built back in '63 and masturbating furtively over memories of Field Days past?

That's the reality of amateur radio today. As long as there are people like you who continue seeking to use yesterday's technology to solve yesterday's problems, I'll expect more whining along the lines of the above.

Let me spell it out for you: USENET - much like the rest of the Internet - was never intended for transport over amateur radio frequencies. That you (and others) do this is one thing, but pissing and moaning about the content of a medium not covered by FCC or international regulations is, frankly, idiotic on your behalf. Don't like it? Send your own damn traffic out over the airwaves. But don't expect the rest of us to kowtow to your demands.

People wonder why amateur radio is dying. You, my good man, exemplify one reason for that *exceptionally* well.

And, for the benefit of the masses who read USENET via their Icoms, Yaesus, or Kenwoods: FUCK SHIT PISS CUNT DICK BALLS ASS TITS BONER.

73s,

- J.

That was almost a sentence. Keep trying; perhaps you'll get it right eventually!

Anyway, I now see why you're so deeply concerned about dirty words on the Internet making it out over the airwaves:

http://groups.yahoo.com/group/BPQ32/message/3118 (May 1, 2010)
http://www.db0anf.de/app/bbs/messages/show-1239_KG6BAJ (May 3, 2010)

As I see it, this leaves you with two options:

- Fix your filters so that they actually work.

- Stop sending USENET posts over the airwaves.

There you go; problem solved.

Also, I'm pretty sure that I forgot to say 'dildo' in my original reply to you. I'd hate to think that you missed out on my use of the word 'dildo', so here's a use of the word 'dildo' just for you:

DILDO.

Some good points.  However, IMHO amateur radio should have no direct
connection to the internet.

Some do. Not all. Not even a significant percentage of all. Myself excepted.

That is possibly illegal considering you are seemingly not vetting the content. That would be the equivalent of transmitting porn videos on 70cm ATV and blaming the people who produced the tape/DVD. Moron. I feel justified on that remark.

Then don't read it, don't transmit it via packet, print it and post it on telephone poles on the corner, forward it to coworkers......

Get it yet?

What is this thread? Where did it come from, and what is it doing in
rec.radio.amateurs.boatanchors?

We don't care about your packet radio nonsense. If it doesn't have an 807
final at least, it probably doesn't belong in this newsgroup.

Sadder yet is the fact that the OP doesn't seem to realize that it's the responsibility of the control operator of the originating system to make sure that the traffic is suitable for sending over amateur radio.

And saddest of all is the OP's seemingly random selection of newsgroups,
especially when he chose to identify himself as "no.spam@no.spam."

Hmm, I think we scared him away. No loss. I doubt he knows what
propagation is about or why some antennas are longer than 19 inches.

That should explain things a bit more - it's really sounding like he's
spent a little too much time with the TNC. I've seen this happen before
when someone doesn't unplug themselves from the shack.

KG6BAJ, if you're reading this, spend some time away from the radios.
It'll help to readjust your perspective.

My Sony ICF-S79V shower radio has a TV band receiver enabling it to get certain analogue TV broadcasts. Starting Feb. 2009, the U.S. is switching to digital TV broadcasts. Are there radios capable of receiving digital broadcasts?

No. The audio in digital TV is digital. But AM and FM will
still work.

That's NOT what he asked.

I know of no radios under design that will pick up DTV audio.

The GNU software-defined radio may do so, and there are DTV boards
for amateur service available from various European experimenters.

You might be able to put one of those $40 DTV converter boxes
to use in that way; many have baseband audio outputs.

Test Preparation Software

Pass your US FCC ham radio license test with ease. Our test preparation software serves as a training aid to help amateurs and prospective amateurs pass the VEC's administered test. When you can consistently pass the test given by our test preparation software, you will almost certainly pass an actual test.

Our ham radio license test preparation software uses the latest officially released VEC's approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the official test.

Hi
Does anyone know if the KAWIN software with the internal logging program for the KAM + will support the Cabrillo format for generating logs submitted for contest activity? I have version 6.49 of the program.
Would appreciate any help or suggestions for other or better software for the KAM+.

Hi,

Ive been out of the ham radio loop for a bit and need some guidance. I have an Icom IC-725 xcvr and want to know what kind of cable and where to get a good deal on it, to connect my Vista computer to my rig. Ive seen some CV-I(?) cables, but dont really know what I need. I have the DXLab suite and would like to use that program as my control program (If there are any better interfaces out there, Id be open to hearing about them). Ive seen some cables for about $14 to $35 that look like they only have a small phone connector on one end and a usb connector on the other, and come with a driver on cd. Is this something that would work for me? Or do I need to look for something else? Any help is appreciated. TIA.

Brian

I have read that with a regular external tnc you can go into converse mode in which you can type a message and the tnc converts it to a packet/packets. The packets can then be sent to another tnc essentially setting up a simplex packet network. I have been playing with APRS and have gotten the user-space soundmodem driver to work with xastir perfectly.

I was wondering if there is anyway to use soundmodem in a type of "converse mode" by just typing a message that is converted by soundmodem? I have tried echoing from the command-line to /dev/soundmodem0 but haven't been able to get it to work. I also tried writing a small python script that would write a string to /dev/soundmodem0, but that also did not work.

Thanks for any help.

There is a difference between a modem and a TNC. A modem just converts
bits to tones and vice-versa. A TNC has a processor and can do
intelligent things like converting typed text into packets. A modem
cannot do that.
When using a modem, there has to be some application that performs the
packet layer functions. In Linux, this function can also partly be
performed by the kernel AX.25 functionality, but you still need the
application to setup the connections and provide the data.

Is there a software who can read a digital signal, either directly

mode is used? I have a recording .wav file here which seems to be in

Can you make it available online for examination? Can you post the
log for the signal (date/time/freq/mode/filters/etc.)?

Hi, just wondering what is a more recent packet radio software that is
still being kept up to date / popular?
Specially I am interested in something with some bbs style
functionality (windows platform).
Thanks,
Scott

I have been off the digital modes since about 2003. Now I would like
to get back on. Which way to go? I work RTTY and PSK but others are
interesting. My rig is an IC756ProII w/ lousy antenna.

Question, hardware or software setup or combination. I prefer a
software interface I think.

Help.

Assuming you have a reasonably fast computer, sound card modes are

about the only way to go these days. Unless you want to work Pactor, which is another matter. There is lots of good free software.
It is easy to build your own computer-to-radio interface, or there are a wide variety of store-bought ones out there.

For software there are the single-mode programs Digipan (PSK) and MMTTY (RTTY), both for Windows. There are multimode programs MultiPSK (windows only) and fldigi (windows and Linux and Unix, including Macintosh) and DM780 (windows only). I won't offer recommendations on the computer-to-radio interface; I build my own.

Greetings,
  Besser Associates is offering their acclaimed

"DSP Made Simple for Engineers" class in
San Diego, California, on 25-27 February 2009.

This 3-day class is particularly well-suited to those involved in RF and audio signal processing, and computer programmers, who need to learn the fundamentals of DSP theory. Details of this course, including target audience, learning objectives, course outline, materials descriptions, and past student comments are contained in this post as items "A" through "I".

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, call Besser Associates or visit http://www.bessercourse.com/ to view our public course catalog and current schedule.

------ Detailed DSP course information follows ------

A. BESSER COURSE TITLE:
"DSP Made Simple for Engineers"; a 3-day tutorial course on digital signal processing (DSP) theory.

B. TARGET AUDIENCE

* The primary audience is practicing RF (and Audio) hardware Engineers and Software Programmers who need to understand digital signal processing (DSP) because of its ever-increasing role in the processing of real-world signals.

* While DSP Made Simple is not a "programming course", it is particularly well suited for computer programmers because of their increasing need to understand DSP algorithms.

* In general, this course is beneficial to anyone involved in the acquisition, generation, transmission, filtering, or analysis of digital signals.

C. WHAT THE STUDENT GAINS FROM THE COURSE:

* The ability to apply DSP techniques to real-world signal processing problems in their work.

* A solid grasp of DSP basics and the ability to move gradually to more sophisticated DSP concepts and applications.

* The ability to speak the language of DSP.

* Much practical information on how to optimize (streamline the computations of) the algorithms of DSP.

* The ability to understand written descriptions (articles, application notes, textbooks) of DSP methods used in practice.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

E. WHAT THE COURSE DOES NOT COVER:

The DSP Made Simple Course does not cover the hardware architecture of commercial programmable DSP integrated circuits. Likewise, while the course introduces the topic of commercially available DSP design software packages, no computer programming is performed as part of the course.

F. COURSE HANDOUT MATERIAL

The training material comprises 475 pages of class handouts. With the typical lecturer, the student must decide between taking notes, or paying attention to what the lecturer is saying. The training handout solves this "note-taking" dilemma. The DSP Made Simple training material provides a "bulletized" description of each DSP topic in addition to an abundance of diagrams. A textual description summarizing the key DSP concepts are included at the bottom of each handout page.

The highly praised DSP textbook, "Understanding Digital Signal Processing, 2/E" (Prentice Hall Publishing) will be supplied to each student. This book has been Amazon.com's top-selling DSP book for over five years.

G. COURSE LECTURER:

RICHARD LYONS is a Consulting Systems Engineer and lecturer with Besser Associates in Mt. View, CA. He has been the Lead Hardware Engineer for numerous large signal processing systems for both the National Security Agency (NSA) and TRW Inc. An experienced lecturer, and past instructor at the University of California Santa Cruz Extension, Richard has delivered signal processing seminars and training courses throughout the US and Europe. As an Associate Editor for the IEEE Signal Processing Magazine, he created and edits the magazine's "DSP Tips & Tricks" column. He has written numerous articles on DSP topics, and authored the best selling textbook "Understanding Digital Signal Processing 2/E"

(Prentice Hall, 2004). He is also the Editor of, and contributor to, the Wiley & Sons/IEEE Press book: "Streamlining DSP, A tricks of the Trade Guidebook". Richard is a member of the IEEE, and Eta Kappa Nu the electrical engineering honor society. He can be contacted at: R.Lyons@ieee.org.

H. WHAT'S GOOD ABOUT THE COURSE

* Instead of overwhelming the student with complex mathematics, the lecturer uses intuitive explanations and well-chosen examples to develop a fundamental understanding of DSP theory. (A recipe for technical material that's too rich in equations is hard for the beginner to digest.)

* The practical aspects of signal processing techniques are stressed as opposed to mathematically rigorous discussions of discrete system theory. THIS COURSE TEACHES THE STUDENTS HOW TO USE DSP IN THEIR WORK.

* Comprehensive in scope, and gentle in approach, the course gives the student a thorough grasp of the basics and the ability to move on to more sophisticated DSP concepts and applications.

* In addition to covering the key practical aspects of DSP, a collection of tricks-of-the-trade used by DSP professionals, to make their processing more efficient, are introduced throughout the course.

* In terms of DSP training, this course is the beginner's best opportunity to efficiently and thoroughly learn the fundamentals of DSP.

I. QUOTES FROM RECENT STUDENTS:

"Excellent course for engineers wanting to get (an) insight into DSP."
- George Hughes, Lockheed Martin

"Instructor takes a traditionally difficult subject to learn, and made it easy. His printed material is excellent."
- William Schnable, Lucent Technologies

"I appreciated the instructor's ability to communicate complex subjects in a simple format. This course is in my top 3 of 'Best Ever' (in 20 years)."
- Brian Kralicek, Nokia

"Lyons presents a very solid engineering perspective of the subject with a minimal, yet sufficient, amount of math."
- Gene Kozin, Itron Inc.

"... great instructor. I now understand what the college
professors were trying to teach."
- Simon Sirin, U.S. Dept. of Energy

"This course takes the mystery out of DSP. Instructor has
a knack for presenting information in a way that is very
logical and easy to understand."
- Dale Laing, Lockheed Martin

"Lyons' is an excellent communicator of highly technical
material. He uses plenty of real examples to translate
theory to something of utility."
- David Day, Day Test and Measurement Inc.

To register for the class, please contact Besser Associates at
650-949-3300. For additional course offerings, call Besser
Associates or visit http://www.bessercourse.com/ to view our

>a PSK31 contest?

That contest is probably over now,
but generally, a modest power and a cautious sound level is better, to
avoid distortion and harmonics. Up to let's say 30-40 W is normal.

Hello all,

I was just wondering if anyone uses or has ever used Pictoaud by Sam Hunt.
Is it still available to download?

I'm trying to get my old Athlon based computer set up for FLDIGI. I
can't seem to get a signal through the soundcard. I know the cables
are ok. I can input the recieve audio to my laptop and the Vista
version will work ok. As soon as i plug into the old computer there is
nothing. I have the correct version for XP. I've cheched for multiple
.dll's and checked out the old Sound Blaster Live! Value card. Using
Windows XP SP3. Anybody else encountered this problem? Thanks... Scott

Go into the sound setting & see if line in is muted or whatever input you
are using. Have found also when SB Live mixer has been installed the inputs
will default to off. Hope that helps...

Hi Howard. Thanks for the reply. All devices are enabled and not
muted. The microhone and speakers all work fine before and after
trying the program. If worse comes to worse I am going to nuke the HD
and reinstall Windows. It's an old Athlon 800mhz that I only keep
because it has comm and printer ports for devices that don't work so
well with USB/comm port adapters. Thanks again 73... Scott..

This version has better support for mappoint 2009 and added support for APRS symbols and overlays, and made several enhancements. Current users please pay special attention to #2, since your current settings may need to be changed,

1. Added support for standard APRS symbols and overlays,
2. Changed the way log files are saved, now you need to provide the name of a folder where logs will be saved, the name of the log file is genarated automatically by appending the date after 'log', so old logs won't be overwritten. You need to create the folder if it doesn't exist. Leave the folder name field empty if you don't want to save logs,
3. Better signal range calculation accuracy to reflect real world operating conditions,
4. Uninstall will no longer remove tnc settings file,

Visit www.aprspoint.com for details.

Hello fellow Hams.

One of the reasons I developed HamSphere - the virtual Ionosphere, was
the lack of sun spot activity. And I expected the system to hold for
say a few years, and then gradually see a declining amount of users as
the real
shortwave ham radio bands woke up again.

But I picked up a QSO on HamSphere the other day regarding sun spots.
And I couldn't beleive my ears. They said that the sun spots might
even disappear??? The sun's activity seems to be the lowest in many
decades.
I haven't been on shortwave lately, but is it really that bad
propagation people say?

Best regards

I've been on the road since the first of the year, so no chance to chase the Triple Play award.

Now that I'm home, it looks like the best way to capture the "Digital" play is via BPSK31.

I have DigiPan Rev 2.0 installed, and the "operating" side of it seems excellent, but its "logging" facility is awkward.

What else is out there which has a little more seamless logging capability. (I need it to spit out an ADIF which TQSL will sign and send to LoTW.)

Since you need to TQSL the file before you send it to LOTW, you will have to do the export to ADIF first no matter which program you choose to do the logging. Eventually I suppose one of them will be re worked to use the certifiate that ARRL issues to sign the file with, but AFAIK none of them do it now.

As far as programs go I use Ham Radio Deluxe. It has a logger built in (you still have to export the ADIF first) and there is hardly any digital mode out there that the associated DM780 program cannot do. It even does SSTV. You can setup DM780 to use the same logbook as HRD or keep a seperate digital log if you wish.

Take a look here :

Hi,

A new feature has been added to the soundcard packet radio modem
'soundmodem' which allows to set/reset the PTT with hamlib, instead of
the serial or parallel connection.

When compiling hamlib, the 'configure' script automatically checks
whether hamlib is installed in the target machine.

The hamlib parameters can then be configured using the utility
'soundmodemconfig', and these parameters are savec in the conf files
this program generates. This patch is completely compatible with
existing configuration files.

It can be downloaded at http://www.baycom.org/~tom/ham/soundmodem/
in the tar file: soundmodem-0.14.tar.gz

The program is dead, not being developed, has not been enhanced in
years. Stay away from orphaned programs and get with something that is
actively being developed, enhanced, and supported by the author.
Everything else is just dead old junk software.

Or better yet, consider learning the code of orphaned opensource
software and thus preserving the work-product of talented and altruistic
folks.

Unforunately, you have no idea of the situation on the ground here. It is petty to vote for someone other than Mr. Romney soley since he said that we do not need the hams. He is quite correct. He never made a disparaging remark about any hams. The Chronicle interviewer was unable to make any concrete point to challenge Mr. Romney's assertation.

Mr. Romney never engaged in such vitrol.

I would caution you to refrain from making such statements.
